Summary

Steffen Rendle

Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim

Pattern	Mining
000	

Association Rules

Summary 00000

Overview

Pattern Mining discovers regularities in data.

- ► Example: a transaction database of a supermarket: *someone* who buys chips also buys beer.
- Frequent patterns are found by counting the occurences in the data base.
- ► Types of patterns: itemsets, association rules, sequences, ...

Pattern	Mining
000	

Association Rules

Summary 00000

900

Example

Shopping Carts
Beer, Chips, Chocolate, Cookies
Coke, Beer, Pizza, Chips
Salad, Noodles, Tomatoes, Water
Lasagne, Coke, Beer, Chips
Oranges, Apple Juice, Rice, Cabbage, Sausage
Diapers, Beer, Charcoal, Sausage
Beer, Cabbage, Sausage, Chips

Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim

Pattern	Mining
000	

Association Rules

Summary 00000

Example

Shopping Carts

Beer, Chips, Chocolate, Cookies

Coke, Beer, Pizza, Chips

Salad, Noodles, Tomatoes, Water

Lasagne, Coke, Beer, Chips

Oranges, Apple Juice, Rice, Cabbage, Sausage

Diapers, Beer, Charcoal, Sausage

Beer, Cabbage, Sausage, Chips

. . .

Observations:

- Many customers buy beer.
- Beer and chips are often bought together.
- Customers who buy cabbage also buy sausage.
- Customers who buy something to eat also buy something to drink.

Pattern	Mining
000	

Association Rules

Summary 00000

Outline

- ► Classification predicts class labels based on training data
- Clustering groups data based on similarity
- Pattern Mining discovers regularities in data

Steffen Rendle

Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim

・ロト ・ 一 ト ・ ヨ ト ・ 日 ト

3

JOC P

SOR

Itemsets

- Which itemsets frequently occur in the same transaction?
- Example: chips and beer are frequently bought together
- ► given
 - Items $I = \{i_i, \ldots, i_m\}$
 - Data $D \subseteq \mathcal{P}(I)$ multiset
 - Frequency threshold θ_s
- ► to find
 - Frequent sets $L = \{X \in \mathcal{P}(I) | support_D(X) \ge \theta_s\}$

Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim

イロト イポト イヨト

 Association Rules

Summary 00000

3

Definitions and Terms

▶ support_D(X) =
$$\frac{|\{d \in D | X \subseteq d\}|}{|D|}$$

• X is frequent / large iff $support_D(X) \ge \theta_s$

Steffen Rendle

Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim

SOR

Trie / Prefix Tree

For candidate generation and frequency counting, a trie can be used:

- ▶ a trie is a tree
- ▶ each node contains an item and a frequency counter
- ▶ each path from the root to a node corresponses to an itemset
- the k-th level represents itemsets of length k
- the items in a trie are ordered

Summary

SOR

Trie: Frequency Counting

To count frequencies with a trie, each transaction $d \in D$ is handled the following way:

- 1. sort d
- 2. start at the root
- 3. for each item $i \in d$ follow the node *i*, increase it by one and recursively repeat this for $d \setminus \{i\}$

Association Rules

- ► Which itemssets Y occur often if another itemset X appears? X ⇒ Y
- ► Example: a customer buying diapers also buys beer {diapers} ⇒ {beer}
- ▶ given
 - Items $I = \{i_i, \ldots, i_m\}$
 - Data $D \subseteq \mathcal{P}(I)$ multiset
 - Frequency thresholds θ_s
 - Confidence threshold θ_c
- ► to find
 - ▶ Rules $R = \{X \Rightarrow Y | support_D(X \Rightarrow Y) \ge \theta_s \land confidence_D(X \Rightarrow Y) \ge \theta_c\}$

SOR

Definitions and Terms

- **support** measures how often the rule $X \Rightarrow Y$ appears
 - $support_D(X \Rightarrow Y) = support_D(X \cup Y)$
 - $X \Rightarrow Y$ is frequent / large iff $support_D(X \Rightarrow Y) \ge \theta_s$
- ► confidence measures how likely it is that Y appears if X is present.

• confidence_D(X
$$\Rightarrow$$
 Y) = $\frac{support_D(X \Rightarrow Y)}{support_D(X)}$

▶ for a rule $X \Rightarrow Y$, Y is called **head** and X is called **body**

000	

Association Rules

Summary 00000

SOR

Observations

expanding the head of a rule by an item of the body, results in a rule with less or equal confidence.

 $\operatorname{confidence}_D(X \setminus Z \Rightarrow Y \cup Z) \leq \operatorname{confidence}_D(X \Rightarrow Y)$

► proof:

$$confidence_D(X \setminus Z \Rightarrow Y \cup Z)$$

$$= \frac{support_D((X \setminus Z) \cup (Y \cup Z))}{support_D(X \setminus Z)} = \frac{support_D(X \cup Y \cup Z)}{support_D(X \setminus Z)}$$

$$\leq \frac{support_D(X \cup Y)}{support_D(X)} = confidence_D(X \Rightarrow Y)$$

► example: confidence_D({a, b} \Rightarrow {c, d}) \leq confidence_D({a, b, c} \Rightarrow {d})

Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim

・ロト ・ 一 ト ・ ヨ ト ・ 日 ト

Pattern	Mining
000	

Association Rules

Summary 00000

DQ P

Remarks

Calculating the confidence can be reduced to calculating the support:

$$\operatorname{confidence}_{D}(I \setminus X \Rightarrow X) = \frac{\operatorname{support}_{D}((I \setminus X) \cup X)}{\operatorname{support}_{D}(I \setminus X)} \ge \theta_{c}$$

$$\Leftrightarrow \frac{\operatorname{support}_{D}(I)}{\operatorname{support}_{D}(I \setminus X)} \ge \theta_{c}$$

$$\Leftrightarrow \operatorname{support}_{D}(I \setminus X) \le \frac{1}{\theta_{c}} \operatorname{support}_{D}(I)$$

If θ_c ≥ θ_s, the values for support_D can be looked up in the trie and no database pass is necessary.

Outlook

- Extensions to Apriori and Eclat
- ► Further pattern: sequences, trees, ...
- Background knowledge: e.g. taxonomies

Steffen Rendle

Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim

(日) (同) (三) (三)

SOR

Sequence mining

Takes the time into account, when an action is performed. E.g.

- ► A database of courses attended by a student in one term, i.e. sequences of sets:
 - Student1: ({linear algebra, c++, algorithm theory}, {machine learning, numerics, economics}, {bayessian networks})
 - Student2: ({linear algebra, java}, {software engineering}, {numerics})
 - Student3: ({linear algebra, java, algorithm theory}, {economics}, {machine learning, numerics}, {bayessian networks})
 - ▶ ...
- A frequent sequence might be ({linear algebra, algorithm theory}, {machine learning, numerics}, {bayessian networks})

Pattern	Mining
000	

Association Rules

Summary 00000

Use taxonomies

Background knowledge in terms of taxonomies might be used for mining patterns. E.g.

- The following taxonomy is given over subjects
 - linear algebra isa mathematics
 - mathematics is a science
 - computer science isa science
- In the student database one could mine the association rule using the taxonomy:

if someone has attended machine learning then (s)he also has attended some mathematic lecture {machine learning} \Rightarrow {mathematics}

Pattern	Mining
000	

Association Rules

DQ P

Conclusion

- Task: Finding frequent patterns in database.
- Efficient algorithms explore only promising candidates by pruning.
- Mining association rules can be reduced to mining itemsets with an additional post processing step.

Steffen Rendle

Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim
