

Machine Learning

0. Introduction

Lars Schmidt-Thieme

Information Systems and Machine Learning Lab (ISMLL) Institute for Computer Science University of Hildesheim, Germany

Syllabus

Fri. 25.10. (1) 0. Introduction

A. Supervised Learning: Linear Models & Fundamentals

- Fri. 1.11. (2) A.1 Linear Regression
- Fri. 8.11. (3) A.2 Linear Classification
- Fri. 15.11. (4) A.3 Regularization
- Fri. 22.11. (5) A.4 High-dimensional Data

B. Supervised Learning: Nonlinear Models

- Fri. 29.11. (6) B.1 Nearest-Neighbor Models
- Fri. 6.12. (7) B.2 Neural Networks
- Fri. 13.12. (8) B.3 Decision Trees
- Fri. 20.12. (9) B.4 Support Vector Machines — Christmas Break —
- Fri. 10.1. (10) B.5 A First Look at Bayesian and Markov Networks

C. Unsupervised Learning

- Fri. 17.1. (11) C.1 Clustering
- Fri. 24.1. (12) C.2 Dimensionality Reduction
- Fri. 31.1. (13) C.3 Frequent Pattern Mining
- Fri. 7.2. (14) Q&A

Outline

- 1. What is Machine Learning?
- 2. A First View at Linear Regression
- 3. Machine Learning Problems
- 4. Lecture Overview
- 5. Organizational Stuff

Process models

Cross Industry Standard Process for Data Mining (CRISP-DM, 1999)

Shiversian Shildesheif

One area of research, many names (and aspects)

machine learning

historically, stresses learning logical or rule-based models (vs. probabilistic models).

data mining, big data

stresses the aspect of large datasets and complicated tasks.

knowledge discovery in databases (KDD)

stresses the embedding of machine learning tasks in applications,

i.e., preprocessing & deployment.

data analysis historically, stresses multivariate regression and unsupervised tasks.

pattern recognition

name preferred by engineers, stresses cognitive applications such as image and speech analysis.

data science, applied statistics

stresses underlying statistical models, testing and methodical rigor.

predictive analytics, business analytics, data analytics stresses business applications.

Outline

1. What is Machine Learning?

2. A First View at Linear Regression

- 3. Machine Learning Problems
- 4. Lecture Overview
- 5. Organizational Stuff

Example

How does gas consumption depend on external temperature?

Example data (Whiteside, 1960s): weekly measurements of

- average external temperature
- total gas consumption (in 1000 cubic feets)

How does gas consumption depend on external temperature?

How much gas is needed for a given temperature ?

Example

The Simple Linear Regression Problem (yet vague)

Given

► a set $\mathcal{D}^{\text{train}} := \{(x_1, y_1), (x_2, y_2), \dots, (x_N, y_N)\} \subseteq \mathbb{R} \times \mathbb{R}$ called training data,

compute the line that describes the data generating process best.

The Simple Linear Model

For given predictor/input $x \in \mathbb{R}$, the simple linear model predicts/outputs

$$\hat{y}(x) := \hat{\beta}_0 + \hat{\beta}_1 x$$

with parameters $(\hat{\beta}_0, \hat{\beta}_1)$ called $\hat{\beta}_0$ intercept / bias / offset $\hat{\beta}_1$ slope

1 predict $-simple-linreg(x \in \mathbb{R}, \hat{\beta}_0, \hat{\beta}_1 \in \mathbb{R})$:

$$\hat{y} := \hat{\beta}_0 + \hat{\beta}_1 x$$

3 return ŷ

When is a Model Good?

We still need to specify what "describes the data generating process best" means. — What are good predictions $\hat{y}(x)$?

Predictions are considered better the smaller the difference between

- an **observed** y_n (for predictors x_n) and
- a **predicted** $\hat{y}_n := \hat{y}(x_n)$

is on average, e.g., the smaller the (pointwise) L2 loss / squared error:

$$\ell(y_n,\hat{y}_n):=(y_n-\hat{y}_n)^2$$

Note: Other error measures such as absolute error $\ell(y_n, \hat{y}_n) = |y_n - \hat{y}_n|$ are also possible, but more difficult to handle.

When is a Model Good?

Pointwise losses are usually averaged over a dataset \mathcal{D} , then just called **error**, e.g.,

$$\operatorname{err}(\hat{y}; \mathcal{D}) := \frac{1}{N} \operatorname{RSS}(\hat{y}; \mathcal{D}) = \frac{1}{N} \sum_{n=1}^{N} (y_n - \hat{y}(x_n))^2$$

or
$$\operatorname{err}(\hat{y}; \mathcal{D}) := \operatorname{RSS}(\hat{y}; \mathcal{D}) := \sum_{n=1}^{N} (y_n - \hat{y}(x_n))^2$$

called residual sum of squares (RSS) or also L2 loss.

Equivalently, often Root Mean Square Error (RMSE) is used:

$$\operatorname{err}(\hat{y}; \mathcal{D}) := \operatorname{RMSE}(\hat{y}; \mathcal{D}) := \sqrt{\frac{1}{N} \sum_{n=1}^{N} (y_n - \hat{y}(x_n))^2}$$

Note: RMSE has the same scale level / unit as the original target y, e.g., if y is measured in meters so is RMSE.

Generalization

We can trivially get a model with error zero on training data, e.g., by simply looking up the corresponding y_n for each x_n :

$$\hat{y}^{\text{lookup}}(x) := \begin{cases} y_n, & \text{if } x = x_r \\ 0, & \text{else} \end{cases}$$
with RSS($\hat{y}^{\text{lookup}}, \mathcal{D}^{\text{train}}) = 0$ optimal

Models should not just reproduce the data, but **generalize**, i.e., predict well on fresh / unseen data (called **test data**).

The Simple Linear Regression Problem

Given

► a set $\mathcal{D}^{\text{train}} := \{(x_1, y_1), (x_2, y_2), \dots, (x_N, y_N)\} \subseteq \mathbb{R} \times \mathbb{R}$ called training data,

compute the parameters $(\hat{eta}_0,\hat{eta}_1)$ of a linear regression function

$$\hat{y}(x) := \hat{\beta}_0 + \hat{\beta}_1 x$$

s.t. for a set $\mathcal{D}^{\text{test}} \subseteq \mathbb{R} \times \mathbb{R}$ called **test set** the **test error**

$$\mathsf{err}(\hat{y};\mathcal{D}^{\mathsf{test}}) := rac{1}{|D^{\mathsf{test}}|} \sum_{(x,y)\in\mathcal{D}^{\mathsf{test}}} (y - \hat{y}(x))^2$$

is minimal.

Note: $\mathcal{D}^{\text{test}}$ has (i) to be from the same data generating process and (ii) not to be available during training.

Least Squares Estimates

As $\mathcal{D}^{\text{test}}$ is not accessible during training, use $\mathcal{D}^{\text{train}}$ as **proxy** for $\mathcal{D}^{\text{test}}$:

► rationale: models predicting well on D^{train} should also predict well on D^{test} as both come from the same data generating process.

The parameters with minimal L2 loss for a dataset $\mathcal{D}^{\text{train}} := \{(x_1, y_1), (x_2, y_2), \dots, (x_N, y_N)\}$ are called (ordinary) least squares estimates:

$$egin{aligned} &\hat{eta}_0, \hat{eta}_1) := rg\min_{\hat{eta}_0, \hat{eta}_1} \mathsf{RSS}(\hat{y}, \mathcal{D}^{\mathsf{train}}) \ & := rg\min_{\hat{eta}_0, \hat{eta}_1} \sum_{n=1}^N (y_n - \hat{y}(x_n))^2 \ & = rg\min_{\hat{eta}_0, \hat{eta}_1} \sum_{n=1}^N (y_n - (\hat{eta}_0 + \hat{eta}_1 x_n))^2 \end{aligned}$$

Learning the Least Squares Estimates

The least squares estimates can be written in closed form:

$$\hat{\beta}_{1} = \frac{\sum_{n=1}^{N} (x_{n} - \bar{x})(y_{n} - \bar{y})}{\sum_{n=1}^{N} (x_{n} - \bar{x})^{2}}$$
$$\hat{\beta}_{0} = \bar{y} - \hat{\beta}_{1} \bar{x}$$

1 learn -simple-linreg(
$$\mathcal{D}^{\text{train}} := \{(x_1, y_1), \dots, (x_N, y_N)\} \in \mathbb{R} \times \mathbb{R}\}:$$

2 $\bar{x} := \frac{1}{N} \sum_{n=1}^{N} x_n$
3 $\bar{y} := \frac{1}{N} \sum_{n=1}^{N} y_n$
4 $\hat{\beta}_1 := \frac{\sum_{n=1}^{N} (x_n - \bar{x})(y_n - \bar{y})}{\sum_{n=1}^{N} (x_n - \bar{x})^2}$
5 $\hat{\beta}_0 := \bar{y} - \hat{\beta}_1 \bar{x}$
6 return $(\hat{\beta}_0, \hat{\beta}_1)$

A Toy Example

Given the data $\mathcal{D} := \{(1,2), (2,3), (4,6)\}$, predict a value for x = 3.

Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany

A Toy Example / Least Squares Estimates Given the data $\mathcal{D} := \{(1, 2), (2, 3), (4, 6)\}$, predict a value for x = 3. Use a simple linear model. $\bar{x} = 7/3$, $\bar{y} = 11/3$.

Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany

A Toy Example / Least Squares Estimates

Given the data $\mathcal{D} := \{(1,2), (2,3), (4,6)\}$, predict a value for x = 3. Use a simple linear model.

$$\hat{\beta}_1 = \frac{\sum_{n=1}^{N} (x_n - \bar{x})(y_n - \bar{y})}{\sum_{n=1}^{N} (x_n - \bar{x})^2} = 57/42 = 1.357$$
$$\hat{\beta}_0 = \bar{y} - \hat{\beta}_1 \bar{x} = \frac{11}{3} - \frac{57}{42} \cdot \frac{7}{3} = \frac{63}{126} = 0.5$$

RSS:

n	Уn	ŷ'n	$(y_n - \hat{y}_n)^2$
1	2	1.857	0.020
2	3	3.214	0.046

\sum			0.071

 $\hat{y}(3) = 4.571$

Outline

- 1. What is Machine Learning?
- 2. A First View at Linear Regression
- 3. Machine Learning Problems
- 4. Lecture Overview
- 5. Organizational Stuff

Regression

Real regression problems are more complex than simple linear regression in many aspects:

- There is more than one predictor.
- ► The target may depend non-linearly on the predictors.

Examples:

. . .

- ► predict sales figures.
- ► predict rating for a customer review.

Example: classifying iris plants (Anderson 1935).

150 iris plants (50 of each species):

- ► species: setosa, versicolor, virginica
- ▶ length and width of sepals (in cm)
- ► length and width of petals (in cm)

Given the lengths and widths of sepals and petals of an instance, which iris species does it belong to?

iris setosa

[source: iris species database, http://www.badbear.com/signa] Iris virginica

	Sepal.Length	Sepal.Width	Petal.Length	Petal.Width	Species
1	5.10	3.50	1.40	0.20	setosa
2	4.90	3.00	1.40	0.20	setosa
3	4.70	3.20	1.30	0.20	setosa
4	4.60	3.10	1.50	0.20	setosa
÷	÷	÷	÷	÷	:
51	7.00	3.20	4.70	1.40	versicolor
52	6.40	3.20	4.50	1.50	versicolor
53	6.90	3.10	4.90	1.50	versicolor
÷	÷	÷	÷	÷	÷
101	6.30	3.30	6.00	2.50	virginica
102	5.80	2.70	5.10	1.90	virginica
103	7.10	3.00	5.90	2.10	virginica
÷	÷	÷	÷	÷	÷
150	5.90	3.00	5.10	1.80	virginica

Example: classifying email (lingspam corpus)

Subject: query: melcuk (melchuk)

does anybody know a working email (or other) address for igor melcuk (melchuk) ?

Subject: '

hello ! come see our naughty little city made especially for adults http://208.26.207.98/freeweek/ enter.html once you get here, you won't want to leave !

legitimate email ("ham")

spam

How to classify email messages as spam or ham?

Subject: query: melcuk (melchuk) does anybody know a working email (or other) address for igor melcuk (melchuk) ?

(а	T	
	address	1	
	anybody	1	
	does	1	
	email	1	
	for	1	
	igor	1	
	know	1	
	melcuk	2	
	melchuk	2	
	or	1	
	other	1	
	query	1	
	working	1)
•			

lingspam corpus:

- ▶ email messages from a linguistics mailing list.
- ▶ 2414 ham messages.
- ▶ 481 spam messages.
- ► 54742 different words.
- ► an example for an early, but very small spam corpus.

All words that occur at least in each second spam or ham message on average (counting multiplicities):

	!	your	will	we	all	mail	from	do	our	email
spam	14.18	7.45	4.36	3.42	2.88	2.77	2.69	2.66	2.46	2.24
ham	0.38	0.46	1.93	0.94	0.83	0.79	1.60	0.57	0.30	0.39
	out	report	order	as	free	lang	uage	universi	ity	
spam	2.19	2.14	2.09	2.07	2.04		0.04	0.	05	
ham	0.34	0.05	0.27	2.38	0.97		2.67	2.	61	

example rule:

if freq("!") \geq 7 and freq("language")=0 and freq("university")=0 then spam, else ham

Should we better normalize for message length?

Reinforcement Learning

A class of learning problems where

- ▶ the correct / optimal action never is shown,
- but only positive or negative feedback for an action actually taken is given.

Example: steering the mountain car.

Observed are

- x-position of the car,
- ► velocity of the car

Possible actions are

- ► accelerate left,
- ► accelerate right,

Reinforcement Learning / TD-Gammon

Program	Hidden	Training	Opponents	Results
_	Units	Games		
TD-Gam 0.0	40	300,000	Other Programs	Tied for Best
TD-Gam 1.0	80	300,000	Robertie, Magriel,	-13 pts / 51 games
TD-Gam 2.0	40	800,000	Var. Grandmasters	-7 pts / 38 games
TD-Gam 2.1	80	1,500,000	Robertie	-1 pts / 40 games
TD-Gam 3.0	80	1,500,000	Kazaros	+6 pts / 20 games

[source: Tesauro [1995]]

See also Google's AlphaGo Zero [Silver et al., 2017] for Go!

Cluster Analysis

Finding groups of similar objects.

Example: sociographic data of the 50 US states in 1977.

state dataset:

- ▶ income (per capita, 1974),
- illiteracy (percent of population, 1970),
- ► life expectancy (in years, 1969–71),
- percent high-school graduates (1970).

Machine Learning 3. Machine Learning Problems

Fundamental Machine Learning Problems

Supervised learning: correct decision is observed (ground truth). Unsupervised learning: correct decision never is observed.

Outline

- 1. What is Machine Learning?
- 2. A First View at Linear Regression
- 3. Machine Learning Problems
- 4. Lecture Overview
- 5. Organizational Stuff

Syllabus

Fri. 25.10. (1) 0. Introduction

A. Supervised Learning: Linear Models & Fundamentals

- Fri. 1.11. (2) A.1 Linear Regression
- Fri. 8.11. (3) A.2 Linear Classification
- Fri. 15.11. (4) A.3 Regularization
- Fri. 22.11. (5) A.4 High-dimensional Data

B. Supervised Learning: Nonlinear Models

- Fri. 29.11. (6) B.1 Nearest-Neighbor Models
- Fri. 6.12. (7) B.2 Neural Networks
- Fri. 13.12. (8) B.3 Decision Trees
- Fri. 20.12. (9) B.4 Support Vector Machines — Christmas Break —
- Fri. 10.1. (10) B.5 A First Look at Bayesian and Markov Networks

C. Unsupervised Learning

- Fri. 17.1. (11) C.1 Clustering
- Fri. 24.1. (12) C.2 Dimensionality Reduction
- Fri. 31.1. (13) C.3 Frequent Pattern Mining
- Fri. 7.2. (14) Q&A

Outline

- 1. What is Machine Learning?
- 2. A First View at Linear Regression
- 3. Machine Learning Problems
- 4. Lecture Overview
- 5. Organizational Stuff

Exercises and Tutorials

- ► weekly exercise sheet with 2 exercises.
- exercises will be corrected.
- ▶ be prepared to present and discuss your solution in the tutorials.
- successful participation in the tutorial gives up to 10% bonus points for the exam.
 - group submissions are fine (but yield no bonus points)
 - ▶ plagiarism is illegal and usually leads to expulsion from the program.
 - ► about plagiarism see https://en.wikipedia.org/wiki/Plagiarism

Tutorial groups

No	Day & Time	Room	Box	Tutor	E-Mail
1	Mon. 8:00-10:00	C213	61	Randolf	scholz@uni-hildesheim.de
2	Mon. 8:00-10:00	B026	62	Thorben	wernerth@uni-hildesheim.de
3	Wed. 8:00-10:00	B026	63	Milan	kalkenin@uni-hildesheim.de
4	Wed. 8:00-10:00	C213	64	Sai	pulicant@uni-hildesheim.de
5	Wed. 14:00-16:00	B026	65	Philip	kurzendo@uni-hildesheim.de

- ► Group 1: Advanced Topics (faster paced)
- ► Group 3: German Tutorial for Bachelor Students (AINF, IMIT, WINF)
- ► Upload/Deadline: Thursday 10:00, except 1st week (Wed. 16:00)
- Fill out Tutorial poll if you haven't already!

Exam and Credit Points

- There will be a written exam at end of term
 - 2h, 4 problems, open book
- ► The course gives 6 ECTS (2+2 SWS).
- The course can be used in
 - ► Angewandte Informatik BSc. / Informatik 5 (mandatory)
 - Angewandte Informatik MSc. / Informatik / Masch. Lernen (elective)
 - for students who did not have it in their Bachelors already
 - ► Data Analytics MSc. / Machine Learning (mandatory)
 - ► IMIT BSc. / Informatik 5 (mandatory)
 - ► IMIT MSc. / Informatik / Maschinelles Lernen (elective)
 - \blacktriangleright for students who did not have it in their Bachelors already
 - ► Wirtschaftsinformatik BSc. / Vertiefung Maschinelles Lernen (elective)
 - Wirtschaftsinformatik MSc. / Business Intelligence / Maschinelles Lernen (elective)
- ► This course is a pre-requisite for most courses at ISMLL.

Simple Linear Regression / Least Squares Estimates / Proof (p. 19):

$$RSS = \sum_{i=1}^{n} (y_i - (\hat{\beta}_0 + \hat{\beta}_1 x_i))^2$$
$$\frac{\partial RSS}{\partial \hat{\beta}_0} = \sum_{i=1}^{n} 2(y_i - (\hat{\beta}_0 + \hat{\beta}_1 x_i))(-1) \stackrel{!}{=} 0$$
$$\implies n\hat{\beta}_0 = \sum_{i=1}^{n} (y_i - \hat{\beta}_1 x_i)$$

Machine Learning

Simple Linear Regression / Least Squares Estimates / Proof

Proof (ctd.):

$$RSS = \sum_{i=1}^{n} (y_i - (\hat{\beta}_0 + \hat{\beta}_1 x_i))^2$$

$$= \sum_{i=1}^{n} (y_i - (\bar{y} - \hat{\beta}_1 \bar{x}) - \hat{\beta}_1 x_i)^2$$

$$= \sum_{i=1}^{n} (y_i - \bar{y} - \hat{\beta}_1 (x_i - \bar{x}))^2$$

$$\frac{\partial RSS}{\partial \hat{\beta}_1} = \sum_{i=1}^{n} 2(y_i - \bar{y} - \hat{\beta}_1 (x_i - \bar{x}))(-1)(x_i - \bar{x}) \stackrel{!}{=} 0$$

$$\implies \qquad \hat{\beta}_1 = \frac{\sum_{i=1}^{n} (y_i - \bar{y})(x_i - \bar{x})}{\sum_{i=1}^{n} (x_i - \bar{x})^2}$$
