#### Outline

#### 1. Stochastic (Sub)gradient Descent

2. Dual Coordinate Descent

#### 3. The Adaptive Multi Hyperplane Machine

#### SVM Optimization Problem / Slack Variables

minimize 
$$\frac{1}{2} ||\beta||^2 + \gamma \sum_{n=1}^{N} \xi_n$$
  
w.r.t.  $y_n(\beta_0 + \beta^T x_n) \ge 1 - \xi_n, \quad n = 1, \dots, \Lambda$   
 $\xi \ge 0$   
 $\beta \in \mathbb{R}^p, \quad \beta_0 \in \mathbb{R}$ 

(4 미) (월) (월) (월) (월) (월) (4 미)

#### SVM Optimization Problem / Slack Variables

minimize 
$$\frac{1}{2}||\beta||^2 + \gamma \sum_{n=1}^{N} \xi_n$$
  
w.r.t.  $y_n(\beta_0 + \beta^T x_n) \ge 1 - \xi_n, \quad n = 1, \dots, N$   
 $\xi \ge 0$   
 $\beta \in \mathbb{R}^p, \quad \beta_0 \in \mathbb{R}$ 

can be rewritten:

minimize 
$$f(\beta) := \frac{1}{2} ||\beta||^2 + \gamma \sum_{n=1}^{N} \max(0, 1 - y_n(\beta_0 + \beta^T x_n)) \qquad |: N : \gamma$$
$$\propto \frac{1}{N} \sum_{n=1}^{N} \max(0, 1 - y_n(\beta_0 + \beta^T x_n)) + \frac{1}{2} \lambda ||\beta||^2, \qquad \lambda := \frac{1}{\gamma N}$$

シック・目前・4回を4回を4日を

### SVM Optimization Problem / Hinge Loss

can be rewritten (ctd.):

minimize 
$$f(\beta) := \frac{1}{2} ||\beta||^2 + \gamma \sum_{n=1}^{N} \max(0, 1 - y_n(\beta_0 + \beta^T x_n))$$
 |:  $N : \gamma$   
 $\propto \frac{1}{N} \sum_{n=1}^{N} \max(0, 1 - y_n(\beta_0 + \beta^T x_n)) + \frac{1}{2} \lambda ||\beta||^2, \quad \lambda := \frac{1}{\gamma N}$   
 $= \frac{1}{N} \sum_{n=1}^{N} \ell_{\text{hinge}}(y_n, \beta_0 + \beta^T x_n) + \frac{1}{2} \lambda ||\beta||^2$ 

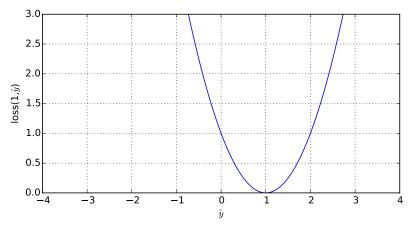

with

$$\ell_{\mathsf{hinge}}(y,\hat{y}) := \max(0,1-y\hat{y})$$

シック エービー・エリット 山下 シック

### (Sub)gradients

f

$$F(\beta) := \frac{1}{N} \sum_{n=1}^{N} \max(0, 1 - y_n(\beta_0 + \beta^T x_n)) + \frac{1}{2} \lambda ||\beta||^2$$
$$= \frac{1}{N} \sum_{\substack{n=1\\y_n(\beta_0 + \beta^T x_n) < 1}}^{N} 1 - y_n(\beta_0 + \beta^T x_n) + \frac{1}{2} \lambda ||\beta||^2$$

・ロト・西ト・ミト・ヨト 山下 ろくの

### (Sub)gradients

$$F(\beta) := \frac{1}{N} \sum_{n=1}^{N} \max(0, 1 - y_n(\beta_0 + \beta^T x_n)) + \frac{1}{2}\lambda ||\beta||^2$$
$$= \frac{1}{N} \sum_{\substack{n=1\\y_n(\beta_0 + \beta^T x_n) < 1}}^{N} 1 - y_n(\beta_0 + \beta^T x_n) + \frac{1}{2}\lambda ||\beta||^2$$

subgradients:

1

$$\frac{\partial f}{\partial \beta} = \frac{1}{N} \sum_{\substack{n=1\\y_n(\beta_0 + \beta^T x_n) < 1}}^{N} -y_n x_n + \lambda \beta$$

\* 다 > \* 문 > \* 분 > \* 분 = \* 1 = \* 이 < 0 >

### (Sub)gradients

$$F(\beta) := \frac{1}{N} \sum_{n=1}^{N} \max(0, 1 - y_n(\beta_0 + \beta^T x_n)) + \frac{1}{2}\lambda ||\beta||^2$$
$$= \frac{1}{N} \sum_{\substack{n=1\\y_n(\beta_0 + \beta^T x_n) < 1}}^{N} 1 - y_n(\beta_0 + \beta^T x_n) + \frac{1}{2}\lambda ||\beta||^2$$

subgradients:

$$\frac{\partial f}{\partial \beta} = \frac{1}{N} \sum_{\substack{n=1\\y_n(\beta_0 + \beta^T x_n) < 1}}^{N} -y_n x_n + \lambda \beta$$

stochastic subgradients:

$$\frac{\partial f}{\partial \beta}|_{\mathcal{D}^{(t)}} = \frac{1}{|\mathcal{D}^{(t)}|} \sum_{\substack{(x,y) \in \mathcal{D}^{(t)} \\ y(\beta_0 + \beta^T x) < 1}}^{N} -yx + \lambda\beta, \quad \mathcal{D}^{(t)} \subseteq \mathcal{D}^{\text{train}}, \text{iteration } t$$

#### Bound on Parameter Norm

$$f(\beta) := \frac{1}{N} \sum_{n=1}^{N} \max(0, 1 - y_n(\beta_0 + \beta^T x_n)) + \frac{1}{2} \lambda ||\beta||^2 N$$

• Q: what is f(0)?

◇>>◇ 単則 〈川・〈川・〈□・〈□・

#### Bound on Parameter Norm

The optimal parameters are bound from above:

$$||\beta^*|| \le \frac{1}{\sqrt{\lambda}}$$

Trivially,

$$egin{aligned} &rac{1}{2}\lambda||eta^*||^2 \leq f(eta^*) \leq f(0) = 1 \ & imes ||eta^*|| \leq rac{\sqrt{2}}{\sqrt{\lambda}} \end{aligned}$$

 $\left[ \text{SSS07} \right]$  have a more complex proof to show the tighter bound (p. 4, end of proof of theorem 1).

・ロト・日本・王王・王王・シック・

use stochastic (sub)gradient descent

$$ilde{eta}^{(t+1)} := eta^{(t)} - \eta^{(t)} rac{\partial f}{\partial eta}|_{\mathcal{D}^{(t)}}$$

use gradient sample size K (aka mini batches)
 though no empirical evidence that K > 1 has any benefits

• after each SGD step, **reproject/rescale**  $\beta$ :

$$eta^{(t+1)} := ilde{eta}^{(t+1)} rac{1}{\mathsf{max}(1,\sqrt{\lambda}\,|| ilde{eta}^{(t+1)}||)}$$

use fixed hyperbola schedule as learning rate:

$$\eta^{(t)} := \frac{1}{\lambda t}$$

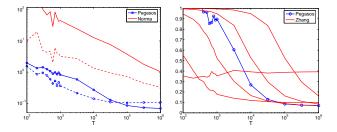

► see [SSS07]

### (Non-Linear) Kernels

SGD in the primal first works for linear kernels.

Any linear model can be kernelized by **representing instances in terms of kernel features**:

original feature representation:

$$x_n \in \mathbb{R}^M, \quad n \in \{1, \ldots, N\}$$

kernel feature representation:

$$\tilde{x}_n \in \mathbb{R}^N, x_{n,m} := k(x_n, x_m), \quad m \in \{1, \dots, N\}$$

then:

$$\hat{y}_{\text{linear}}(\tilde{x}_n;\beta) = \beta^T \tilde{x}_n = \sum_{m=1}^N \beta_m \tilde{x}_{n,m}$$
$$= \sum_{m=1}^N \alpha_m k(x_m, x_n) = \hat{y}_{\text{kernel } k}(x_n; \alpha), \quad \alpha_m := \beta_m$$

Outline

1. Stochastic (Sub)gradient Descent

2. Dual Coordinate Descent

#### 3. The Adaptive Multi Hyperplane Machine

シック 비로 《프 > 《트 > 《唱 > 《 = >

#### **Dual Problem**

Remember, the dual problem was:

minimize 
$$f(\alpha) := \frac{1}{2} \alpha^T Q \alpha - \mathbf{1}^T \alpha$$
,  $Q_{n,m} := y_n y_m x_n^T x_m$   
w.r.t.  $\alpha \in [0, \frac{1}{N\lambda}]$ 

10 / 20

#### **Dual Problem**

Remember, the dual problem was:

minimize 
$$f(\alpha) := \frac{1}{2} \alpha^T Q \alpha - 1^T \alpha$$
,  $Q_{n,m} := y_n y_m x_n^T x_m$   
w.r.t.  $\alpha \in [0, \frac{1}{N\lambda}]$ 

coordinate descent w.r.t. coordinate  $\alpha_n$ :

$$f_n(\alpha_n) := f(\alpha_n; \alpha_{-n}) \propto \frac{1}{2} Q_{n,n} \alpha_n^2 + Q_{n,-n} \alpha_{-n} \alpha_n - \alpha_n$$
$$\frac{\partial f_n}{\partial \alpha_n} = Q_{n,n} \alpha_n + Q_{n,-n} \alpha_{-n} - 1 \stackrel{!}{=} 0$$
$$\rightsquigarrow \alpha_n = \frac{1 - Q_{n,-n} \alpha_{-n}}{Q_{n,n}}$$

possibly clip  $\alpha_n$ :

$$\alpha_n = \max(0, \min(\frac{1}{N\lambda}, \frac{1 - Q_{n, -n}\alpha_{-n}}{Q_{n, n}}))$$

・日本・四本・山本・山本・日本

Complexity

$$\begin{aligned} Q_{n,m} &:= y_n y_m x_n^T x_m, & x_n \in \mathbb{R}^M, y_n \in \mathbb{R} \\ \alpha_n &= \max(0, \min(\frac{1}{N\lambda}, \frac{1 - Q_{n, - n} \alpha_{-n}}{Q_{n, n}})), & Q \in \mathbb{R}^{N \times N}, \alpha \in \mathbb{R}^N \end{aligned}$$

Q: what is the complexity of computing α<sub>n</sub> and what is the complexity of a full epoch?

《日》《四》《日》《日》《日》《日》《

#### Avoid Computing $Q_{n,-n}\alpha_{-n}$

$$\alpha_n^{(t+1)} := \frac{1 - Q_{n,-n} \alpha_{-n}^{(t)}}{Q_{n,n}}$$
$$= \frac{1 - Q_{n,-\alpha} \alpha^{(t)} + Q_{n,n} \alpha_n^{(t)}}{Q_{n,n}}$$
$$= \alpha_n^{(t)} - \frac{Q_{n,-\alpha} \alpha^{(t)} - 1}{Q_{n,n}}$$
$$= \alpha_n^{(t)} - \frac{y_n \hat{y}_n^{(t)} - 1}{Q_{n,n}}$$

もって 正則 ふかく ふやく 白を

Avoid Computing  $Q_{n,-n}\alpha_{-n}$ 

with

 $\hat{y}_n^{(t)} = (\beta^{(t)})^T x_n$ 

and due to

$$\beta^{(t)} = \sum_{n=1}^{N} \alpha_n^{(t)} y_n x_n$$

as only  $\alpha_n^{(t)}$  changes:

$$\beta^{(t+1)} := \beta^{(t)} + (\alpha_n^{(t+1)} - \alpha_n^{(t)}) y_n x_n$$

- accelerates from  $O(N^2)$  to O(M) (for a single  $\alpha_n$ )
- even O(M<sub>nz</sub>) for sparse predictor vectors x
   (M<sub>nz</sub> being the average number of nonzeros)

#### Performance Comparison

Table 2. On the right training time for a solver to reduce the primal objective value to within 1% of the optimal value; see (20). Time is in seconds. The method with the shortest running time is boldfaced. Listed on the left are the statistics of data sets: l is the number of instances and n is the number of features.

Data set		Data statis	tics	Li	near L1-S	M	Linea	r L2-SV	VМ
Data set	l	n	# nonzeros	DCDL1	Pegasos	SVM <sup>perf</sup>	DCDL2	PCD	TRON
a9a	32,561	123	451,592	0.2	1.1	6.0	0.4	0.1	0.1
astro-physic	62,369	99,757	4,834,550	0.2	2.8	2.6	0.2	0.5	1.2
real-sim	72,309	20,958	3,709,083	0.2	2.4	2.4	0.1	0.2	0.9
news20	19,996	1,355,191	9,097,916	0.5	10.3	20.0	0.2	2.4	5.2
yahoo-japan	176,203	832,026	23,506,415	1.1	12.7	69.4	1.0	2.9	38.2
rcv1	677,399	47,236	49,556,258	2.6	21.9	72.0	2.7	5.1	18.6
yahoo-korea	460,554	3,052,939	$156,\!436,\!656$	8.3	79.7	656.8	7.1	18.4	286.1

Note: L1-SVM uses the hinge loss, L2-SVM the squared hinge loss.

#### Universiter Eligeshein

#### Performance Comparison (2/2)

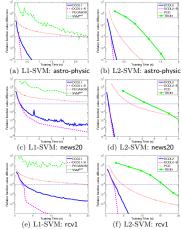

Figure 1. Time versus the relative error (20). DCDL1-S, DCDL2-S are DCDL1, DCDL2 with shrinking. The dotted line indicates the relative error 0.01. Time is in seconds.

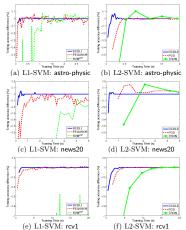

Figure 2. Time versus the difference of testing accuracy between the current model and the reference model (obtained using strict stopping conditions). Time is in seconds.

#### Multi-Class SVM

multi-class SVM:

$$\hat{y}(x) := \underset{y \in \mathcal{Y}}{\arg \max s_y(x)}$$

$$s_y(x; \beta) := \beta_y^T x, \quad \beta_y \in \mathbb{R}^M \quad \forall y \in \mathcal{Y} = \{\tilde{y}_1, \dots, \tilde{y}_L\}$$

$$f(\beta) := \frac{1}{N} \sum_{n=1}^N \ell(y_n, x_n) + \frac{\lambda}{2} ||\beta||^2, \quad \beta := (\beta_{\tilde{y}_1}, \beta_{\tilde{y}_2}, \dots, \beta_{\tilde{y}_L})$$

#### Multi-Class SVM

multi-class SVM:

$$\begin{split} \hat{y}(x) &:= \operatorname*{arg\,max}_{y \in \mathcal{Y}} s_{y}(x) \\ s_{y}(x;\beta) &:= \beta_{y}^{T}x, \quad \beta_{y} \in \mathbb{R}^{M} \quad \forall y \in \mathcal{Y} = \{\tilde{y}_{1}, \dots, \tilde{y}_{L}\} \\ f(\beta) &:= \frac{1}{N} \sum_{n=1}^{N} \ell(y_{n}, x_{n}) + \frac{\lambda}{2} ||\beta||^{2}, \quad \beta := (\beta_{\tilde{y}_{1}}, \beta_{\tilde{y}_{2}}, \dots, \beta_{\tilde{y}_{L}}) \\ \ell(y, x; \beta) &:= \max(0, \quad 1 - s_{y}(x)) \end{split}$$

Q: Is this a useful loss?

シック 비로 《王》《王》 《臣》 《日》

#### Multi-Class SVM

multi-class SVM:

$$\begin{split} \hat{y}(x) &:= \operatorname*{arg\,max}_{y \in \mathcal{Y}} s_{y}(x) \\ s_{y}(x;\beta) &:= \beta_{y}^{T} x, \quad \beta_{y} \in \mathbb{R}^{M} \quad \forall y \in \mathcal{Y} = \{\tilde{y}_{1}, \dots, \tilde{y}_{L}\} \\ f(\beta) &:= \frac{1}{N} \sum_{n=1}^{N} \ell(y_{n}, x_{n}) + \frac{\lambda}{2} ||\beta||^{2}, \quad \beta := (\beta_{\tilde{y}_{1}}, \beta_{\tilde{y}_{2}}, \dots, \beta_{\tilde{y}_{L}}) \\ \ell(y, x; \beta) &:= \max(0, \quad 1 - s_{y}(x)) \end{split}$$

Q: Is this a useful loss?

margin-based loss:

$$\ell(y, x; \beta) := \max(0, 1 + \max_{y' \in \mathcal{Y}, y' \neq y} s_{y'}(x) - s_y(x))$$

シック・目前・4回を4回を4日を

#### Multi-Hyperplane Machine

multi-hyperplane score function:

$$s_{y}(x;\beta) := \max_{k=1,\ldots,K} \beta_{y,k}^{T} x, \quad \beta_{y,k} \in \mathbb{R}^{M}, k \in \{1,\ldots,K\}$$

margin-based loss:

$$\ell(y, x; \beta) := \max(0, 1 + \max_{y' \in \mathcal{Y}, y' \neq y} s_{y'}(x) - s_y(x))$$

relaxation / convex upper bound:

$$\ell(y_n, x_n; \beta, z_n) := \max(0, 1 + \max_{y' \in \mathcal{Y}, y' \neq y_n} s_{y'}(x_n) - \beta_{y_n, z_n}^T x_n)$$

• block coordinate descent / EM type training ( $\beta$ , z)

• use SGD to train  $\beta$ .

- (日本) (四本) (日本) (日本) (日本) (日本)

#### SGD for Training the Multi-Hyperplane Machine

relaxation / convex upper bound:

$$\ell(y_n, x_n; \beta, z_n) := \max(0, 1 + \max_{y' \in \mathcal{Y}, y' \neq y_n} s_{y'}(x_n) - \beta_{y_n, z_n}^T x_n)$$

gradient:

$$\frac{\partial \ell}{\partial \beta_{y,k}}(y_n, x_n; z_n) = \begin{cases} x_n, & \text{if } (y, k) = \arg \max_{\substack{y' \in \mathcal{Y}, y' \neq y_n \\ k'=1, \dots, K}} \beta_{y', k'}^T x_n \\ -x_n, & \text{if } (y, k) = (y_n, z_n) \\ 0, & \text{otherwise} \end{cases}$$

Adaptive Multi-Hyperplane Machine:

• initialize  $\beta \equiv 0$ .

 if all β<sup>T</sup><sub>y',k'</sub>x < 0<sup>T</sup>x<sub>n</sub> = 0, create a new hyperplane K + 1 with β<sub>y,K+1</sub> = 0 (conceptually infinite number of hyperplanes)

#### Performance Comparison

Table 3: Error rate and training time comparison with large-scale algorithms (RBF SVM is solved by LibSVM unless specified otherwise. Poly2 and LibSVM results are from [5]).

	Error rate (%)					Training time (seconds) <sup>1</sup>

#### Summary

- Linear SVMs can be interpreted as linear models with a specific classification loss, the hinge loss.
  - not penalizing scores for positive labels > 1 (as squared error) nor encouraging such scores (as logistic loss).
- Linear SVMs simply can be learned by stochastic (sub)gradient descent.
  - ► an additional **reprojection step** can accelerate convergence.
- Linear and nonlinear SVMs can be trained using coordinate descent in the dual.
  - for nonlinear SVMs each step is expensive:  $O(N^2)$
  - ▶ for linear SVMs, the primal parameters can be maintained, yielding a training procedure in O(M) or even O(M<sub>nonzero</sub>)
- Both learning algorithms for linear SVMs are among the fastest currently known.
- Nonlinear SVMs can be approximated by multiple hyperplanes.
  - always using the most positive one (maximum over score functions)
  - ► hyperplanes can be added as needed, once a point is on the wrong side of all hyperplanes.
