Optimization Problems

find an $x \in \mathcal{X}$ with $f(x)$ maximal

or for short

$$\arg \max_{x \in \mathcal{X}} f(x)$$

- ▶ $f : \mathbb{R}^N \rightarrow \mathbb{R}$: **objective function**
- ▶ $\mathcal{X} \subseteq \mathbb{R}^N$: **feasible area**, e.g., $\mathcal{X} := \mathbb{R}^N$
- ▶ $x \in \mathcal{X}$: **optimization variables** x_1, x_2, \dots, x_N
- ▶ $x^* \in \arg \max_{x \in \mathcal{X}} f(x)$: **optimum, solution**

Example

Plastic Cup Factory

A local family-owned plastic cup manufacturer wants to optimize their production mix in order to maximize their profit. They produce personalized beer mugs and champagne glasses. The profit on a case of beer mugs is \$25 while the profit on a case of champagne glasses is \$20. The cups are manufactured with a machine called a plastic extruder which feeds on plastic resins. Each case of beer mugs requires 20 lbs. of plastic resins to produce while champagne glasses require 12 lbs. per case. The daily supply of plastic resins is limited to at most 1800 pounds. About 15 cases of either product can be produced per hour. At the moment the family wants to limit their work day to 8 hours.

source: <https://sites.math.washington.edu/~burke/crs/407/notes/section1.pdf>

Example

product	resources		profit	amount
	materials	time		
A	20	1/15	25	x_1
B	12	1/15	20	x_2
limit	≤ 1800	≤ 8	max.	

Example

product	resources		profit	amount
	materials	time		
A	20	1/15	25	x_1
B	12	1/15	20	x_2
limit	≤ 1800	≤ 8	max.	

$$\max 25x_1 + 20x_2$$

$$\text{s.t. } 20x_1 + 12x_2 \leq 1800$$

$$1/15x_1 + 1/15x_2 \leq 8$$

$$x_1, x_2 \geq 0$$

Example

product	resources		profit	amount
	materials	time		
A	20	1/15	25	x_1
B	12	1/15	20	x_2
limit	≤ 1800	≤ 8	max.	

$$\begin{aligned}
 &\max 25x_1 + 20x_2 \\
 &\text{s.t. } 20x_1 + 12x_2 \leq 1800 \\
 &1/15x_1 + 1/15x_2 \leq 8 \\
 &x_1, x_2 \geq 0
 \end{aligned}$$

$$\begin{aligned}
 &\max c^T x \\
 &\text{s.t. } Bx \leq b \\
 &x \geq 0 \\
 &\text{with } c, x \in \mathbb{R}^N \\
 &B \in \mathbb{R}^{Q \times N} \\
 &b \in \mathbb{R}^Q
 \end{aligned}$$

Linear Optimization Problems

- ▶ A problem $\max c^T x$
 s.t. $Bx \leq b$
 $x \geq 0$
 with $c, x \in \mathbb{R}^N$, $B \in \mathbb{R}^{Q \times N}$, $b \in \mathbb{R}^Q$

is called **linear optimization problem**.

- ▶ linear objective $f(x) := c^T x$
- ▶ $Bx \leq b$ are called **inequality constraints**
 - ▶ Q linear constraints
 - ▶ define the **feasible area** $\mathcal{X} := \{x \in \mathbb{R}^N \mid Bx \leq b, x \geq 0\}$
- ▶ most simple optimization problem
- ▶ linear optimization problems without constraints are unbounded
 - ▶ no optimum exists, problem makes no sense
- ▶ the optimum always is at the **border of the feasible area**.
 $\partial \mathcal{X} = \{x \in \mathcal{X} \mid \exists q : (Bx)_q = b_q \text{ or } \exists n : x_n = 0\}$

Slack Variables

- ▶ Introduce Q further variables x_{N+1}, \dots, x_{N+Q} to measure the slack of each constraint:

$$x_{N+1:N+Q} := b - Bx \geq 0$$

- ▶ each variable $x_n, n = 1:N + Q$ represents a constraint / a border of the feasible region:
 - ▶ $x_n, n = 1:N$ the constraint $x_n \geq 0$ and
 - ▶ $x_{N+q}, q = 1:Q$ the constraint $B_{q,\cdot}^T x \leq b_q$
 - ▶ $x_n = 0$ means the constraint is sharp, i.e., x is on the respective border
- ▶ a linear objective assumes its maximum at the border of the feasible region,
 - ▶ always N constraints are sharp

Simplex Tableau

- ▶ start with

$$\begin{aligned}x_{1:N} &:= 0_N \\ x_{N+1:N+Q} &:= b - B x_{1:N} = b\end{aligned}$$

then holds

$$\begin{pmatrix} B & I_{Q \times Q} \\ c & 0_Q \end{pmatrix} x_{1:N+Q} = \begin{pmatrix} b \\ 0 \end{pmatrix}$$

- ▶ coefficients can be collected in a matrix called **simplex tableau**:

$$T := \begin{pmatrix} B & I_{Q \times Q} & b \\ c & 0_Q & 0 \end{pmatrix}$$

Pivot Step

$$T := \begin{pmatrix} B & I_{Q \times Q} & b \\ c & 0_Q & 0 \end{pmatrix}$$

- ▶ if $c_n > 0$, we can increase the objective by increasing x_n
- ▶ but increasing x_n may also decrease some slacks x_{N+q} :
for each $q = 1:Q$ check:
 - ▶ if $B_{q,n} > 0$, then we may increase x_n maximally by

$$\frac{b_q}{B_{q,n}}$$

- ▶ thus choose

$$q := \arg \min_{q=1:Q} \frac{b_q}{B_{q,n}}$$

$$x_n := \frac{b_q}{B_{q,n}}, \quad x_{N+q} := 0$$

- ▶ make column n the q -th unit vector I_q (same as in Gaussian elimin.):
 - ▶ normalize row q s.t. the pivot cell gets 1: $T_{q,.} := T_{q,.} / T_{q,n}$
 - ▶ eliminate column n in all other rows: $T_{r,.} := T_{r,.} - T_{r,n} T_{q,.}$

Stop and Solution

- ▶ stop once there is no positive c_n anymore.
- ▶ solution x^* :
 - ▶ non-zero x_n^* are those having unit vector l_q (for a $q \in 1:Q$) in column n of the final tableau
 - ▶ their value is just $T_{q,N+Q+1}$

Worked Example

$$\begin{aligned} \max c^T x &= (5 \ 4 \ 3)^T x \\ \text{s.t. } Bx &= \begin{pmatrix} 2 & 3 & 1 \\ 4 & 1 & 2 \\ 3 & 4 & 2 \end{pmatrix} x \leq b = \begin{pmatrix} 5 \\ 11 \\ 8 \end{pmatrix} \\ x &\geq 0 \end{aligned}$$

Worked Example

$$\begin{aligned} \max c^T x &= (5 \ 4 \ 3)^T x \\ \text{s.t. } Bx &= \begin{pmatrix} 2 & 3 & 1 \\ 4 & 1 & 2 \\ 3 & 4 & 2 \end{pmatrix} x \leq b = \begin{pmatrix} 5 \\ 11 \\ 8 \end{pmatrix} \\ x &\geq 0 \end{aligned}$$

$$T^{(0)} := \begin{pmatrix} B & I_{Q \times Q} & b \\ c^T & 0_Q & 0 \end{pmatrix} = \begin{pmatrix} 2 & 3 & 1 & 1 & 0 & 0 & 5 \\ 4 & 1 & 2 & 0 & 1 & 0 & 11 \\ 3 & 4 & 2 & 0 & 0 & 1 & 8 \\ 5 & 4 & 3 & 0 & 0 & 0 & 0 \end{pmatrix}$$

Worked Example

$$T^{(0)} = \begin{pmatrix} 2 & 3 & 1 & 1 & 0 & 0 & 5 \\ 4 & 1 & 2 & 0 & 1 & 0 & 11 \\ 3 & 4 & 2 & 0 & 0 & 1 & 8 \\ 5 & 4 & 3 & 0 & 0 & 0 & 0 \end{pmatrix}$$

Note: $T^{(0)}$ pivot (1, 1)

Worked Example

$$T^{(0)} = \begin{pmatrix} 2 & 3 & 1 & 1 & 0 & 0 & 5 \\ 4 & 1 & 2 & 0 & 1 & 0 & 11 \\ 3 & 4 & 2 & 0 & 0 & 1 & 8 \\ 5 & 4 & 3 & 0 & 0 & 0 & 0 \end{pmatrix}$$

$$T^{(1)} = \begin{pmatrix} 1 & 3/2 & 1/2 & 1/2 & 0 & 0 & 5/2 \\ 0 & -5 & 0 & -2 & 1 & 0 & 1 \\ 0 & -1/2 & 1/2 & -3/2 & 0 & 1 & 1/2 \\ 0 & -7/2 & 1/2 & -5/2 & 0 & 0 & -25/2 \end{pmatrix}$$

Note: $T^{(0)}$ pivot (1, 1)

Worked Example

$$T^{(0)} = \begin{pmatrix} 2 & 3 & 1 & 1 & 0 & 0 & 5 \\ 4 & 1 & 2 & 0 & 1 & 0 & 11 \\ 3 & 4 & 2 & 0 & 0 & 1 & 8 \\ 5 & 4 & 3 & 0 & 0 & 0 & 0 \end{pmatrix}$$

$$T^{(1)} = \begin{pmatrix} 1 & 3/2 & 1/2 & 1/2 & 0 & 0 & 5/2 \\ 0 & -5 & 0 & -2 & 1 & 0 & 1 \\ 0 & -1/2 & 1/2 & -3/2 & 0 & 1 & 1/2 \\ 0 & -7/2 & 1/2 & -5/2 & 0 & 0 & -25/2 \end{pmatrix}$$

$$T^{(2)} = \begin{pmatrix} 1 & 2 & 0 & 2 & 0 & 11 & 2 \\ 0 & -5 & 0 & -2 & 1 & 0 & 1 \\ 0 & -1 & 1 & -3 & 0 & 22 & 1 \\ 0 & -3 & 0 & -1 & 0 & -11 & -13 \end{pmatrix}$$

Note: $T^{(0)}$ pivot (1, 1), $T^{(1)}$ pivot (3, 3).

Worked Example

$$T^{(0)} = \begin{pmatrix} 2 & 3 & 1 & 1 & 0 & 0 & 5 \\ 4 & 1 & 2 & 0 & 1 & 0 & 11 \\ 3 & 4 & 2 & 0 & 0 & 1 & 8 \\ 5 & 4 & 3 & 0 & 0 & 0 & 0 \end{pmatrix}$$

$$T^{(1)} = \begin{pmatrix} 1 & 3/2 & 1/2 & 1/2 & 0 & 0 & 5/2 \\ 0 & -5 & 0 & -2 & 1 & 0 & 1 \\ 0 & -1/2 & 1/2 & -3/2 & 0 & 1 & 1/2 \\ 0 & -7/2 & 1/2 & -5/2 & 0 & 0 & -25/2 \end{pmatrix}$$

$$T^{(2)} = \begin{pmatrix} 1 & 2 & 0 & 2 & 0 & 11 & 2 \\ 0 & -5 & 0 & -2 & 1 & 0 & 1 \\ 0 & -1 & 1 & -3 & 0 & 22 & 1 \\ 0 & -3 & 0 & -1 & 0 & -11 & -13 \end{pmatrix}$$

$$x^* = (2 \ 0 \ 1)^T \text{ with } c^T x^* = 13$$

Note: $T^{(0)}$ pivot (1, 1), $T^{(1)}$ pivot (3, 3).

Simplex Algorithm (for $x = 0_N$ feasible, i.e. $b \geq 0$)

```

1 max-simplex( $c, B, b$ ):
2    $T := \begin{pmatrix} B & I_{Q \times Q} & b \\ c^T & 0_Q & 0 \end{pmatrix}$ 
3    $(n, q) := \text{find-pivot}(T)$ 
4   while  $(n, q) \neq (-1, -1)$ :
5      $T_{q,\cdot} = T_{q,\cdot} / T_{q,n}$ 
6     for  $r := 1:Q+1, r \neq q$ :
7        $T_{r,\cdot} := T_{r,\cdot} - T_{r,n} T_{q,\cdot}$ 
8      $(n, q) := \text{find-pivot}(T)$ 
9
10   $x := 0_N$ 
11  for  $n := 1:N$ :
12    if  $\exists q \in 1:Q : T_{\cdot,n} = I_q$ :
13       $x_n := T_{q,N+Q+1}$ 
14  return  $x$ 

15 find-pivot( $T$ ):
16   $N_s := \{n \in 1:N \mid T_{Q+1,n} > 0\}$ 
17  if  $\exists n \in N_s : T_{-(Q+1),n} \leq 0_Q$ 
18    raise exception "problem unbounded"
19  if  $N_s = \emptyset$ :
20    return  $(-1, -1)$ 
21   $n := \arg \max_{n \in N_s} T_{Q+1,n}$ 
22   $q := \operatorname{argmin}_{q=1:Q, T_{q,n} > 0} \frac{T_{q,N+Q+1}}{T_{q,n}}$ 
23  return  $(n, q)$ 

```

Note: $I_n := (\mathbb{I}(m = n))_{m \in 1:N} = (0 \dots 0 \ 1 \ 0 \dots 0)^T$ with a 1 at index n .

Optimization Problems

An **optimization problem** has the form:

$$\text{minimize } f(x)$$

where

- ▶ $f : \mathbb{R}^N \rightarrow \mathbb{R}$
- ▶ An optimal x^* exists and $f(x^*) = p^*$

Optimization Problems — A simple example

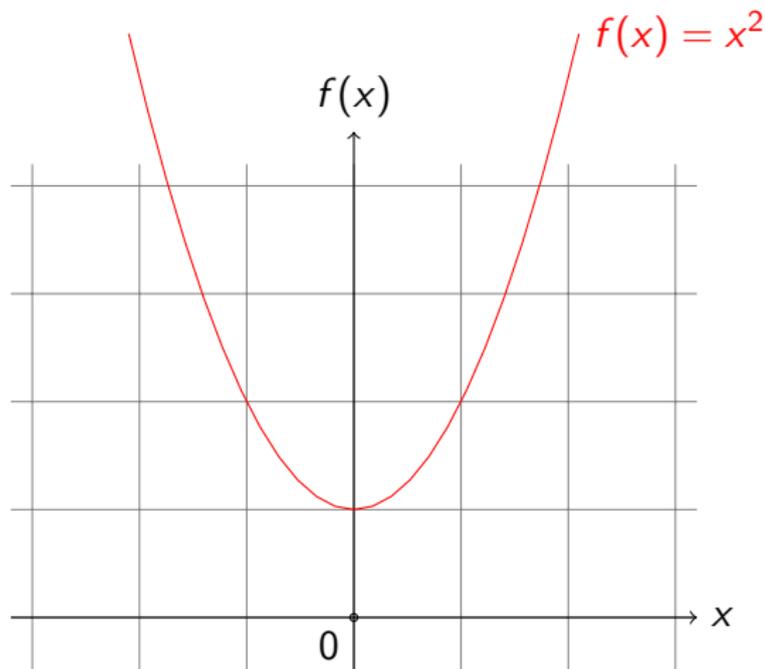

Say we have $f(x) = x^2 + 1$:

$$\text{minimize } x^2 + 1$$

Optimization Problems — A simple example

Say we have $f(x) = x^2 + 1$:

minimize $x^2 + 1$

Optimization Problems — A simple example

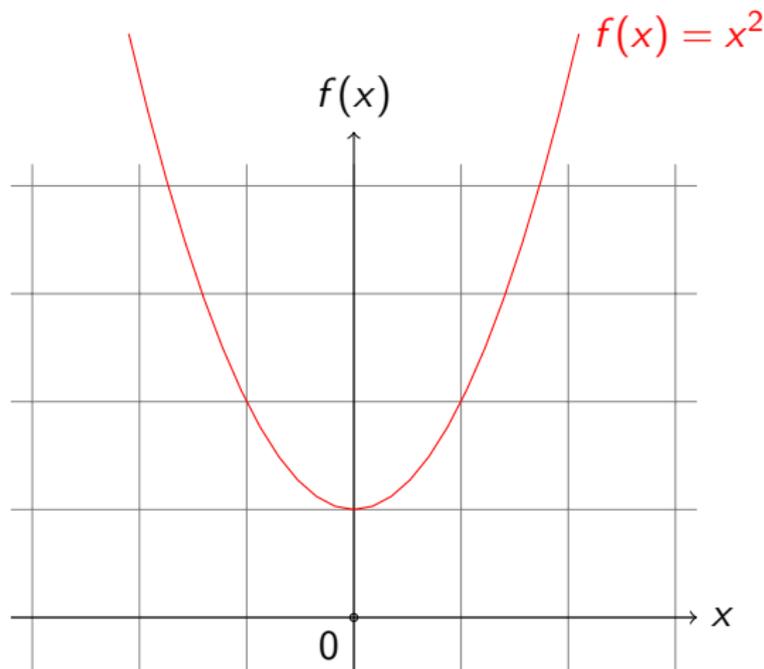

Say we have $f(x) = x^2 + 1$:

$$\text{minimize } x^2 + 1$$

$$\frac{\partial f(x)}{\partial x} \stackrel{!}{=} 0$$

$$2x = 0$$

$$x = 0$$

Optimization Problems — A simple example

Say we have $f(x) = x^2 + 1$:

$$\text{minimize } x^2 + 1$$

$$\frac{\partial f(x)}{\partial x} \stackrel{!}{=} 0$$

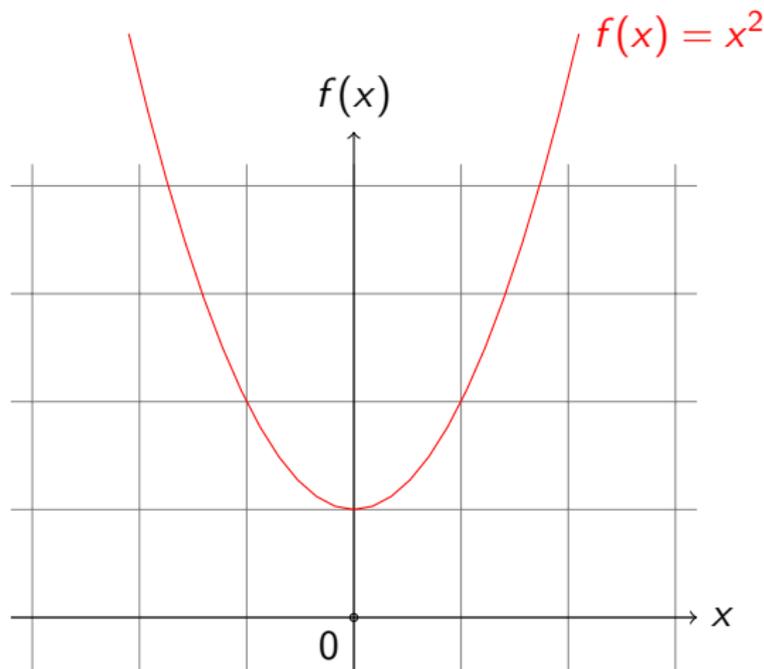

$$2x = 0$$

$$x = 0$$

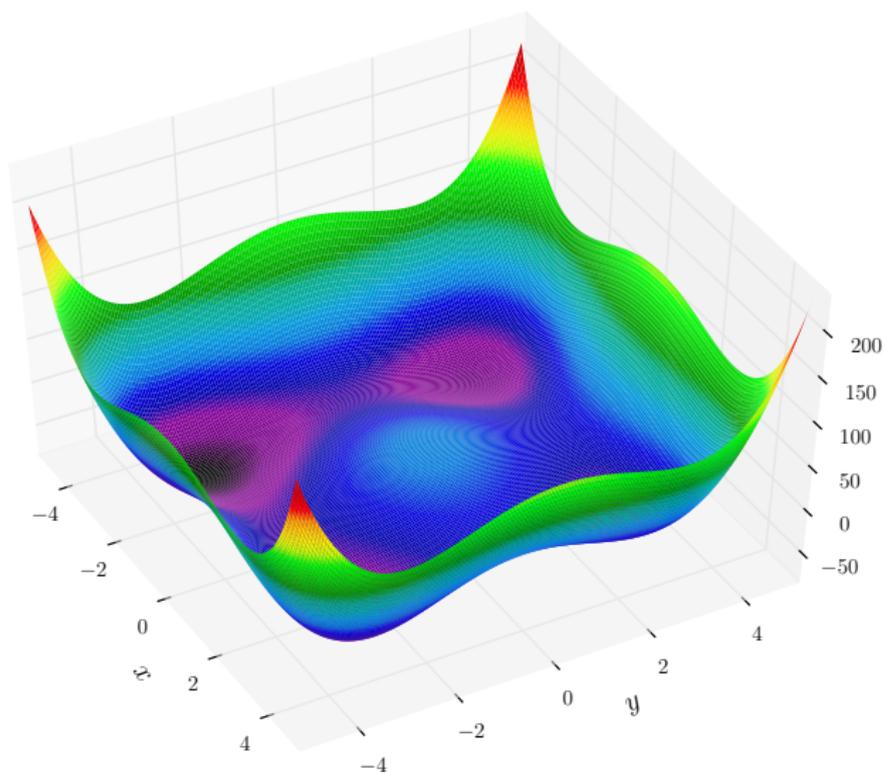

So:

$$x^* = 0$$

$$p^* = f(x^*) = 0^2 + 1 = 1$$

Optimization Problems

Optimization Problems — Constraints

A **constrained optimization problem** has the form:

$$\begin{array}{ll} \text{minimize} & f(x) \\ \text{subject to} & g_p(x) = 0, \quad p = 1, \dots, P \\ & h_q(x) \leq 0, \quad q = 1, \dots, Q \end{array}$$

where

- ▶ $f : \mathbb{R}^N \rightarrow \mathbb{R}$
- ▶ $g_1, \dots, g_P : \mathbb{R}^N \rightarrow \mathbb{R}$
- ▶ $h_1, \dots, h_Q : \mathbb{R}^N \rightarrow \mathbb{R}$
- ▶ an optimal x^* exists

Optimization Problems — Vocabulary

minimize $f(x)$

subject to $g_p(x) = 0, \quad p = 1, \dots, P$
 $h_q(x) \leq 0, \quad q = 1, \dots, Q$

where

- ▶ $f : \mathbb{R}^N \rightarrow \mathbb{R}$ is the **objective function**
- ▶ $x \in \mathbb{R}^N$ is the **optimization variable**
- ▶ $g_p : \mathbb{R}^N \rightarrow \mathbb{R}, p = 1 : P$ are the **equality constraint functions**
 - ▶ usually g_p are linear: $g_p(x) := A_{p,\cdot}x - a_p, A \in \mathbb{R}^{P \times N}, a \in \mathbb{R}^P$
- ▶ $h_q : \mathbb{R}^N \rightarrow \mathbb{R}, q = 1 : Q$ are the **inequality constraint functions**

6. Organizational Stuff

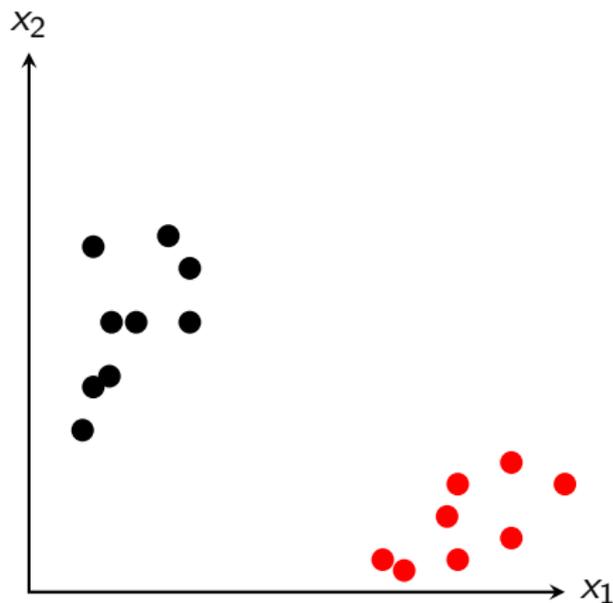

What is optimization good for?

The optimization problem is an abstraction of the problem of making the best possible choice of a vector in \mathbb{R}^N from a set of candidate choices

Classification

There are many different ways to group mathematical optimization problems:

- ▶ Linear vs. Non-linear
- ▶ Convex vs. Non-convex
- ▶ Constrained vs. Unconstrained

Linear vs. Non-Linear Problems

A function $f : \mathbb{R}^N \rightarrow \mathbb{R}$ is **linear** if it satisfies

$$f(\alpha x + \beta y) = \alpha f(x) + \beta f(y)$$

where

- ▶ $x, y \in \mathbb{R}^N$
- ▶ $\alpha, \beta \in \mathbb{R}$

Linear vs. Non-Linear Problems

A function $f : \mathbb{R}^N \rightarrow \mathbb{R}$ is **linear** if it satisfies

$$f(\alpha x + \beta y) = \alpha f(x) + \beta f(y)$$

where

- ▶ $x, y \in \mathbb{R}^N$
- ▶ $\alpha, \beta \in \mathbb{R}$

An optimization problem

$$\text{minimize } f(x)$$

is said to be **linear** if

- ▶ the objective function f is linear.

Remember: linear **unconstrained** problems make no sense as they are unbounded.

Convex Functions

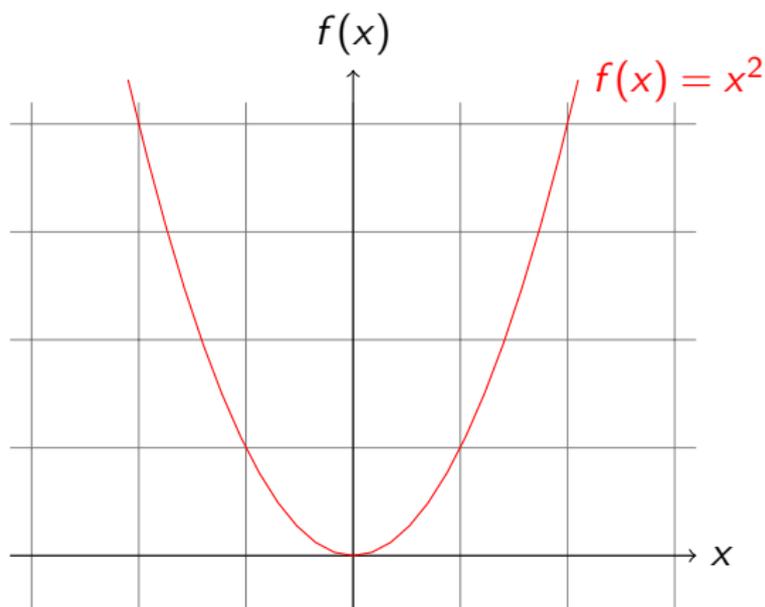

A function $f : \mathbb{R}^N \rightarrow \mathbb{R}$ is **convex** if it satisfies

$$f(\alpha x + \beta y) \leq \alpha f(x) + \beta f(y)$$

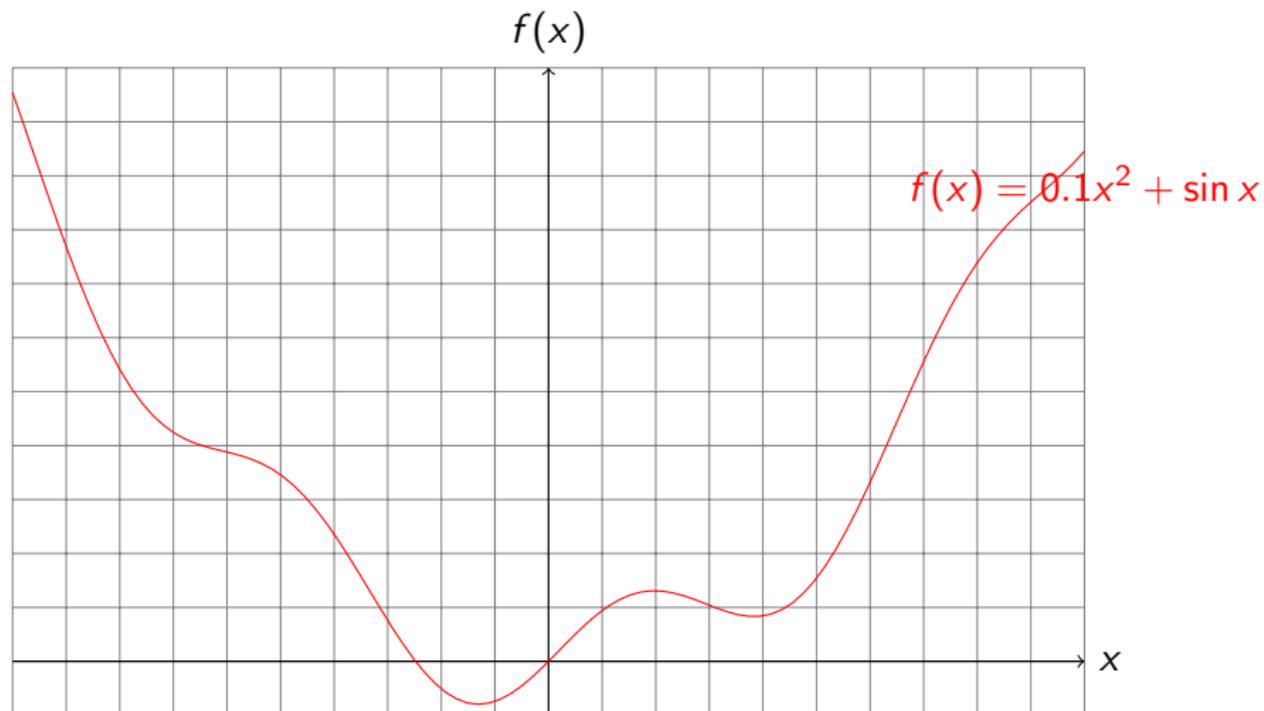

where

- ▶ $x, y \in \mathbb{R}^N$
- ▶ $\alpha, \beta \in \mathbb{R}$
- ▶ $\alpha + \beta = 1, \alpha \geq 0, \beta \geq 0$

A convex function

A non-convex function

Convex vs. Non-Convex Optimization Problem

An (unconstrained!) optimization problem

$$\text{minimize } f(x)$$

is said to be **convex** if

- ▶ the objective function f is convex.

Constrained vs. Unconstrained Problems

An **unconstrained optimization problem** has only

- ▶ the objective function f

minimize $f(x)$

Constrained vs. Unconstrained Problems

An **unconstrained optimization problem** has only

- ▶ the objective function f

$$\text{minimize } f(x)$$

A **constrained optimization problem** has besides

- ▶ objective function f
- ▶ the **equality constraint functions** g_1, \dots, g_P and/or
- ▶ the **inequality constraint functions** h_1, \dots, h_Q

$$\begin{aligned} & \text{minimize } f(x) \\ & \text{subject to } g_p(x) = 0, \quad p = 1, \dots, P \\ & \quad \quad \quad h_q(x) \leq 0, \quad q = 1, \dots, Q \end{aligned}$$

Linear vs. Non-Linear Constrained Problems

A constrained optimization problem

$$\begin{array}{ll} \text{minimize} & f(x) \\ \text{subject to} & g_p(x) = 0, \quad p = 1, \dots, P \\ & h_q(x) \leq 0, \quad q = 1, \dots, Q \end{array}$$

is said to be **linear** if

- ▶ the objective function f ,
- ▶ the equality constraints g_1, \dots, g_P and
- ▶ the inequality constraints h_1, \dots, h_Q are linear.

Linear vs. Non-Linear Constrained Problems

A linear constrained optimization problem can be written as

$$\begin{aligned} & \text{minimize} && f(x) := c^T x \\ & \text{subject to} && g(x) := Ax - a = 0 \\ & && h(x) := Bx - b \leq 0 \end{aligned}$$

with

- ▶ a vector $c \in \mathbb{R}^N$,
- ▶ a matrix $A \in \mathbb{R}^{P \times N}$, a vector $a \in \mathbb{R}^P$ and
- ▶ a matrix $B \in \mathbb{R}^{Q \times N}$, a vector $b \in \mathbb{R}^Q$.

Convex vs. Non-Convex Constrained Problems

A constrained optimization problem

$$\begin{array}{ll} \text{minimize} & f(x) \\ \text{subject to} & g_p(x) = 0, \quad p = 1, \dots, P \\ & h_q(x) \leq 0, \quad q = 1, \dots, Q \end{array}$$

is said to be **convex** if

- ▶ the objective function f and
- ▶ the inequality constraints h_1, \dots, h_Q are convex and
- ▶ the equality constraints g_1, \dots, g_P are even linear.

Exercises and Tutorials (1/2)

- ▶ weekly sheet with 2 exercises
 - ▶ handed out **each Monday** 12:00 am at LearnWeb
https://www.ismll.uni-hildesheim.de/lehre/opt-17w/index_en.html.
 - ▶ 1st sheet will be handed out on 28.10.

- ▶ Solutions to the exercises can be submitted directly via post box at Samelsonplatz
 - ▶ until **next Friday 12:00pm**
 - ▶ 1st sheet is due on Friday 08.11.

- ▶ Exercises will be corrected.

Exercises and Tutorials (2/2)

- ▶ Tutorials:
 - ▶ **Tue, 8am - 10am (Samelsonplatz B025; Nourhan Ahmed)** and
 - ▶ **Wed, 2pm - 4am (Samelsonplatz B025; Mohsan Jameel)**starting next week.

- ▶ Successful participation in the tutorial gives up to 10% bonus points for the exam.
 - ▶ group submissions are OK (but yield no bonus points)
 - ▶ Plagiarism is illegal and usually leads to expulsion from the program.
 - ▶ about plagiarism see <https://en.wikipedia.org/wiki/Plagiarism>

Exams and credit points

- ▶ There will be a written exam at the end of the term (2h, 4 problems).
- ▶ The course gives 6 ECTS (2+2 SWS)
- ▶ The course can be used in
 - ▶ Data Analytics MSc. (mandatory)
 - ▶ IMIT and AINF MSc. / Informatik / Gebiet KI & ML (elective)
 - ▶ Wirtschaftsinformatik MSc / Business Intelligence (elective)

Some books

- ▶ Stephen Boyd, Lieven Vandenberghe (2004):
Convex Optimization, Cambridge University Press.
- ▶ David G. Luenberger, Yinyu Ye (2008; 3rd):
Linear and Nonlinear Programming, Springer.
- ▶ Jorge Nocedal, Steven Wright (2006):
Numerical Optimization, Springer.
- ▶ Igor Griva, Stephen G. Nash, Ariela Sofer (2009):
Linear and nonlinear optimization, SIAM.
- ▶ Dimitri P. Bertsekas (2016; 3rd):
Nonlinear Programming, Athena Scientific.

Further Readings

- ▶ to review linear optimization:
 - ▶ [Luenberger and Ye, 2008, ch. 2 and 31].
- ▶ general introduction to convex optimization:
 - ▶ [Boyd and Vandenberghe, 2004, ch. 1].
 - ▶ [Luenberger and Ye, 2008, ch. 1].
 - ▶ [Nocedal and Wright, 2006, ch. 1].
 - ▶ [Griva et al., 2009, ch. 1].
