# II. XML / 4. XML Path Language (XPath)

### 1. XPath Data Model

### 2. XPath Path Expressions

### 3. XPath Expressions

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

1/42

# XPath Specification

XML Path Language is an expression language for XSLT & XQuery consisting of

1. XQuery 1.0 and XPath 2.0 Data Model (Rec-2007/01/23),
2. XML Path Language (XPath) 2.0 (Rec-2007/01/23),
3. XQuery 1.0 and XPath 2.0 Functions and Operators (Rec-2007/01/23)

as well as further documents (Formal Semantics, Requirements, Use Cases, etc.).

XPath 2.0 is a superset of XPath 1.0 (REC-1999/11/16) that improves by

- using (node) sequences instead of node sets,
- exploiting type information available through XML Schema,
- adding some powerful language constructs (e.g., if- and for-expressions).

XPath 2.0 is implemented, e.g., in Saxon (but not yet in Xalan).

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

1/42

# Abstract Types in XML Schema

In XML Schema types can serve two different purposes:

- as types to associate information items with,
- as basetypes for derived types.

If a type should only be used as basetype, it can be declared **abstract**.

Figure 1: Abstract basetypes in XML Schema type hierarchy.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

2/42

## Additional Datatypes in XPath

There are 5 new datatypes defined in the XPath namespace

http://www.w3.org/2003/11/xpath-datatypes

- `untyped`,
- `anyAtomicType` (abstract) and `untypedAtomic`,
- and two duration types `dayTimeDuration` and `yearMonthDuration`.

Figure 2: Additional types from XPath.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

3/42

## Node Kinds

The XPath Data Model describes a XML document as a tree with nodes of 7 different kinds:

**document node** unique root node of the tree
($\neq$ root element of the XML document !),

**element node** for each element,

**text node** for character data in element contents,

**processing-instruction node** for each PI,

**comment node** for each comment,

**attribute node** for each attribute of each element
(in most contexts not regarded as node, e.g., `node()`),

**namespace node** for each xmlns-attribute of each element
(no longer exposed in XPath 2.0).

Only element nodes can occur as interior nodes of the tree.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

4/42

```
1 <?xml version="1.1"?>
2 <!-- first ideas -->
3 <?xml-stylesheet href='article.css' type='text/css'?>
4 <article author="John Doe" version="2004/06/07">
5  <title>What <em>others</em> say</title>
6  A <em>short</em><!-- 20 pages--> overview ...
7 </article>
```
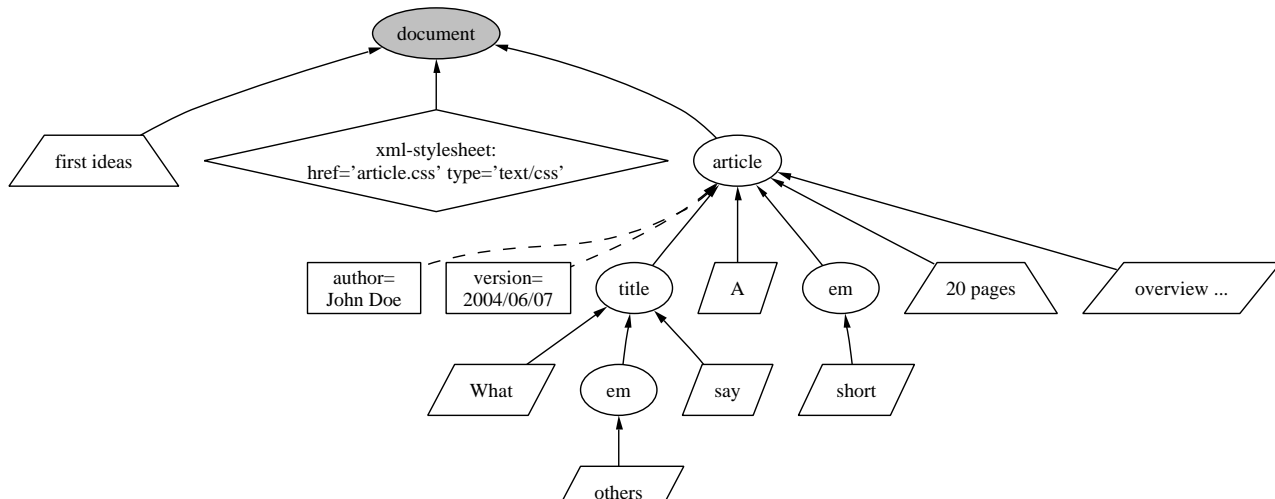

Figure 3: Sample document

Figure 4: Document tree of the sample document.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

5/42

## Document Order

The set of nodes carries a total order called **document order**
(that is partially implementation-dependent).
For two nodes $x, y$:

$x \prec y :\Leftrightarrow x$ is the parent of $y$,

     or $x$ and $y$ are siblings and

         ($x$ is a namespace and $y$ is not

         or $x$ is an attribute and $y$ is neither a namespace nor an attribute

         or $x, y$ are elements, PIs, comments or text and $x$ occurs in XML before $y$)

Document order is any total order that extends the transitive hull of $\prec$,
i.e., the order of

- two namespace nodes or

- two attribute nodes

of the same element is implementation-dependent.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

6/42

## 11 Accessors

| | document | element | attribute | namespace | PI | comment | text |
|---|---|---|---|---|---|---|---|
| node-kind | document | element | attribute | namespace | processing-instruction | comment | text |
| base-uri | base-uri/p | base-uri/p | /p | – | base-uri/p | /p | /p |
| parent | – | g | g | g | g | g | g |
| node-name | – | name | name | prefix | target | – | – |
| type | – | type | type | – | – | – | uA |
| string-value | cc | value/cc | value | ns-uri | content | content | content |
| typed-value | as uA | value/cc | value | as uA | as xs:string | as xs:string | as uA |
| children | g | g | – | – | – | – | – |
| attributes | – | g | – | – | – | – | – |
| namespaces | – | g | – | – | – | – | – |
| nilled | – | g | – | – | – | – | – |

g = given / stored property, /p = or property of parent, – = empty list (), uA = xdt:untypedAtomic,

cc = concatenation of the contents of all its text-node descendants in document order.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

7/42

## Accessors / typed-value

For element or attribute nodes $x$:

$$\text{type}(x) := \begin{cases} \textit{QName of type of } x, & \text{if } x \text{ is schema-validated,} \\ \text{xdt:untypedAny}, & \text{if } x \text{ is an element node,} \\ \text{xdt:untypedAtomic}, & \text{if } x \text{ is an attribute node} \end{cases}$$

$$\text{string-value}(x) := \begin{cases} \textit{string representation of the value of } x, \\ \quad \text{if } x \text{ is of simple type or complex type / simple content} \\ \textit{concatenation of the contents of all its text-node descendants}, \\ \quad \text{otherwise} \end{cases}$$

$$\text{typed-value}(x) := \begin{cases} \textit{value of } x, \\ \quad \text{if } x \text{ is of simple type or complex type / simple content} \\ \text{string-value}(x) \textit{ as } \text{xdt:untypedAtomic}, \\ \quad \text{if type}(x) = \text{xdt:untypedAny or complex type/mixed content} \\ \textit{error}, \\ \quad \text{if } x \text{ is of of complex type / complex content} \end{cases}$$

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

8/42

Course on XML and Semantic Web Technologies, summer term 2007

14/42

## Axis Steps / Node Tests

**Absolute path expressions** start with the document node as **context node**, for **relative path expressions** the context node is set by the host language.

**Step expressions** successively shift the context node.

**Axis** selects a sequence of nodes relative to the context node ("scope").

**Node tests** allow to choose a subsequence of these nodes by tests on names or types / kinds.

**Predicates** allow more complex choices of subsequences of these nodes.

Sequences of nodes are always in document order.
Context positions are assigned starting from 1

- in document order for forward axes and
- in reverse document order for reverse axes.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

15/42

## Axis Steps / Node Tests / Example

Course on XML and Semantic Web Technologies, summer term 2007

20/42

## Performing XPath Queries by Saxon

XPath queries can be performed, e.g., by Saxon.

/descendant-or-self::title[contains(string(.),"XML")]/parent::node()/child::author

Figure 15: File `books.xpath` containing an XPath query.

call (with saxon.jar in classpath):

java net.sf.saxon.Query -s books-short.xml books.xpath

```
<?xml version="1.0" encoding="UTF-8"?>
<author>R.E.</author>
<?xml version="1.0" encoding="UTF-8"?>
<author>S.E.</author>
<?xml version="1.0" encoding="UTF-8"?>
<author>E.R.</author>
```

Figure 16: Result of the XPath query above.

Course on XML and Semantic Web Technologies, summer term 2007

21/42

## Axis Steps / Kind Tests

⟨*KindTest*⟩ := `document-node (` ElementTest? `)`
        | ElementTest
        | `text ( )`
        | `processing-instruction ( (` ⟨*NCName*⟩ `)? )`
        | `comment ( )`
        | AttributeTest
        | `node ( )`

⟨*ElementTest*⟩ := `element ( ( (` ⟨*SchemaContextPath*⟩ ⟨*QName*⟩ `)`
        | `( (`⟨*QName*⟩ `|` `*` `) (` `,` `(`⟨*QName*⟩ `|` `*` `)` `nillable`? `)? ) )? )`

⟨*AttributeTest*⟩ := `attribute ( ( (` ⟨*SchemaContextPath*⟩ ⟨*QName*⟩ `)`
        | `(`⟨*QName*⟩ `|` `*` `) (` `,` `(`⟨*QName*⟩ `|` `*` `) )? ) )? )`

⟨*SchemaContextPath*⟩ := `(` ⟨*QName*⟩ `| (` `type (` ⟨*QName*⟩ `) ) ) / (` ⟨*QName*⟩ `/ )`*

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

22/42

## Axis Steps / Abbreviated Syntax

| abbreviation | meaning |
|---|---|
| no axis name | child:: axis |
| e.g., section/para | child::section/child::para |
| @ as axis name | attribute:: axis |
| e.g., section/@no | child::section/attribute::no |
| // | /descendant-or-self::node()/ |
| e.g., section//para | child::section/descendant-or-self::node()/child::para |
| .. | parent::node() |
| e.g., ../section | parent::node()/child::section |
| [number] | [position()=number] |
| e.g., section[1] | section[position()=1] |

/descendant-or-self::title[contains(string(.),"XML")]/parent::node()/
child::author[position()=1]

can be written more compactly as

//title[contains(string(.),"XML")]/../author[1]

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

23/42

## Axis Steps / Abbreviated Syntax

Do not confuse

$$//section[1]$$
$$= /descendant-or-self::node()/child::section[1]$$

with

$$/descendant::section[1]$$

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

24/42

## Accessors

Most accessors of the XPath data model can be queried:

| accessor | XPath expression |
|---|---|
| node-kind | [Node-kind tests] |
| base-uri | base-uri(x) |
| parent | x/.. |
| node-name | node-name(x) |
|  | local-name(x) |
|  | namespace-uri(x) |
| type | [castable-as and instance-of tests] |
| string-value | string(x) |
| typed-value | data(x) |
| children | x/node() |
| attributes | x/@* |
| namespaces | get-in-scope-prefixes(x) |
|  | get-namespace-uri-for-prefix(prefix) |
| nilled |  |

If a sequence of atomic values is expected in a context,
then the typed value `data(x)` of a node is returned (**atomization**).

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

25/42

# II. XML / 4. XML Path Language (XPath)

### 1. XPath Data Model

### 2. XPath Path Expressions

### 3. XPath Expressions

Course on XML and Semantic Web Technologies, summer term 2007

26/42

## Expressions

$\langle Expr \rangle := \langle ExprSingle \rangle$ ( **,** $\langle ExprSingle \rangle$ )*

$\langle ExprSingle \rangle := \langle PrimaryExpr \rangle$
$\qquad\qquad | \langle Expr \rangle \langle Operator \rangle \langle Expr \rangle$
$\qquad\qquad | \langle PathExpr \rangle$
$\qquad\qquad | \langle ForExpr \rangle$
$\qquad\qquad | \langle QuantifiedExpr \rangle$
$\qquad\qquad | \langle IfExpr \rangle$
$\qquad\qquad | \langle TypeExpr \rangle$

$\langle ExprComment \rangle :=$ ( **:** ( $\langle ExprCommentContent \rangle | \langle ExprComment \rangle$ )* **:** )

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

26/42

# Primary expressions

⟨*PrimaryExpr*⟩ := ⟨*IntegerLiteral*⟩ | ⟨*DecimalLiteral*⟩ | ⟨*DoubleLiteral*⟩
              | ⟨*StringLiteral*⟩
              | \$ ⟨*QName*⟩                            /* variable reference */
              | .                                    /* context item */
              | ⟨*QName*⟩ ( ( ⟨*ExprSingle*⟩ ( , ⟨*ExprSingle*⟩ )* )? )
                                          /* function call */
              | ( ⟨*Expr*⟩? )

Variables can be bound by

- for-expressions,

- quantified expressions, and

- the host language (XSL, XQuery).

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007
27/42

# Working with Numbers

XPath has the usual operators for numerical values (+, -, *, `mod`).

Division is written as `div` (as / is already used for step-expressions).
`idiv` is used for interger division.

XPath has the basic functions `abs, ceiling, floor, round`.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007
28/42

| function | returns |
|---|---|
| string-length$(x)$ | length of string $x$ |
| substring$(x, f, l)$ | substring of $x$ starting at $f$ and of length $l$. |
| concat$(x, y, ...)$ | concatenation of two or more strings |
| string-join$(x, s)$ | concatenation of the strings in sequence $x$ using separator $s$. |
| normalize-space$(x)$ | whitespace-normalization of $x$. |
| upper-case$(x)$ | upper-cased value of $x$. |
| lower-case$(x)$ | lower-cased value of $x$. |
| translate$(x, y, z)$ | $x$ with all occurrences of characters in $y$ replaced by characters in $z$ at same position. |
| contains$(x, y)$ | true, if $x$ contains $y$. |
| starts-with$(x, y)$ | true, if $x$ starts with $y$. |
| ends-with$(x, y)$ | true, if $x$ ends with $y$. |
| substring-before$(x, y)$ | substring of $x$ before first occurrence of $y$. |
| substring-after$(x, y)$ | substring of $x$ after first occurrence of $y$. |
| matches$(x, r)$ | true, if $x$ matches the regular expression $r$. |
| replace$(x, r, q)$ | $x$ with all substrings matched by the regexp. $r$ replaced by $q$. |
| tokenize$(x, r)$ | a sequence of substrings of $x$ separated by substrings of $x$ that match the regexp. $r$. |

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

29/42

## Working with Sequences

Sequences can be explicitly constructed by the concatenation operator ",".

| function | returns |
|---|---|
| count$(s)$ | length of sequence $s$. |
| avg$(s)$, sum$(s)$, min$(s)$, max$(s)$ | average, sum, minimum, maximum of sequence $s$. |
| zero-or-one$(s)$, one-or-more$(s)$, exactly-one$(s)$ | $s$, if count$(s) \in \{0, 1\}$, $\geq 1$, $= 1$. |
| distinct-values$(s)$ | sequence containing each element of $s$ exactly on |
| insert-before$(s, i, t)$ | $s$ with $t$ inserted at position $i$. |
| remove$(s, i)$ | $s$ without item at position $i$. |
| reverse$(s)$ | $s$ in reverse order. |
| subsequence$(s, f, l)$ | subsequence of $s$ starting at $f$ and of length $l$. |
| index-of$(s, x)$ | sequence of positions at which $x$ occurs in $s$. |
| empty$(s)$, exists$(s)$ | true, if count$(s) = 0$, $\neq 0$. |

Strings are not sequences but atomic types !

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

30/42

## Working with Sequence / Filter Steps

So called filter steps implement indexed access to sequences:

- $x[i]$ returns the $i$-th element of the sequence $x$.
  (with $i$ a numeric expression).

- $x[b]$ returns all items of sequence $x$ for which $b$ evaluates to true
  (with $b$ a boolean expression that may contain the context item ".").

"Filter steps" cannot be chained by "/" (contrary to axis steps).
But predicates "[...]" can be chained.

| XPath expression | result |
|---|---|
| (1,3,2)[2] | 3 |
| (1,3,2)[. ge 2] | 3,2 |
| tokenize("The quick brown fox jumps over the lazy dog.", " ")[string-length(.) < 4] | "The", "fox", "the" |
| (1,3,2)[. ge 2][. lt 3] | 2 |

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

31/42

## Working with Sequence / Comparison Operators

XPath has 3 different sets of comparison operators:

**value comparison:** eq, ne, lt, le, gt, and ge.
  Operands must be atomic, otherwise a type error is raised.

**general comparison:** =, !=, <, <=, >, and >=.
  Operands may be sequences.
  The comparison evaluates to true, if it holds between any two items in the respective sequences
  (existentially quantification).

**node comparison:** is, $<<$, $>>$.
  Operands must be single nodes.
  "is" checks node identity, $<<$ and $>>$ document order.

Sample expressions applied to `books-short.xml`:

| XPath expression | result |
|---|---|
| //book[2]/author eq "E.R" | true |
| //book[1]/author eq "R.E" | [ERROR] |
| //book[1]/author = "R.E" | true |

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

32/42

## Working with Sequences of Nodes

| expression | result |
|---|---|
| $x$ union $y$, $x|y$ | sequence containing nodes in $x$ or in $y$ exactly once in document order |
| $x$ intersect $y$ | sequence containing nodes in $x$ and in $y$ exactly once in document order |
| $x$ except $y$ | sequence containing nodes in $x$ but not in $y$ exactly once in document order |

These operators do not work for sequences of atomic values.

Sample expressions applied to `books-short.xml`:

| expression | result |
|---|---|
| (//book[1]/author) union (//book[2]/author) | \<author>R.E.\</author> \<author>S.E.\</author> \<author>E.R.\</author> |
| (//book[2]/author) union (//book[2]/author) | \<author>E.R.\</author> |

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007
33/42

## Loop Expressions (for)

⟨*ForClause*⟩ := for $ ⟨*QName*⟩ in ⟨*ExprSingle*⟩
    ( , $ ⟨*QName*⟩ in ⟨*ExprSingle*⟩ )*
    return ⟨*ExprSingle*⟩

for returns a sequence where each item is
the result of the evaluation of the return-expression
for the variables bound to the items of the for-expressions successively.

XPath variables are "read-only" and cannot be modified.

Variables bound by XPath expressions (as by for) are of local scope of that expressions.

Variables also can be bound by constructs of the host language (XSL, XQuery).

## Loop Expressions (for)

```
1 <?xml version="1.1"?>
2 <books>
3   <book isbn="0-596-00420-6">
4     <author>Erik T. Ray</author><title>Learning XML</title><year>2003</year></bo
5   <book isbn="1-565-92580-7">
6     <author>Norman Walsh</author><author>Leonard Muellner</author>
7     <title>DocBook: The Definitive Guide</title><year>1999</year></book>
8   <book isbn="no">
9     <author>Jon Doe</author><author>Alice Smith</author><author>Bob Miller</au
10    <title>About something</title><year>1990</year></book>
11 </books>
```

Figure 17: Sample document.

```
1 for $x in //book return
2   concat($x/author[1], ": ", $x/title, ", ", $x/year, ".")
```

Figure 18: Sample XPath query.

```
1 Erik T. Ray: Learning XML, 2003.
2 Norman Walsh: DocBook: The Definitive Guide, 1999.
3 Jon Doe: About something, 1990.
```

Figure 19: Result of the sample query on the sample document.

Course on XML and Semantic Web Technologies, summer term 2007

35/42

## Conditional Expressions (if)

$$\langle \mathit{IfExpr} \rangle := \texttt{if (} \langle \mathit{Expr} \rangle \texttt{ ) then } \langle \mathit{ExprSingle} \rangle \texttt{ else } \langle \mathit{ExprSingle} \rangle$$

If a boolean value is expected in a context (as here in the if-expression), then its **Effective Boolean Value** is computed:

$$\text{Effective Boolean Value}(x) := \begin{cases} \text{false,} & \text{if } x = \text{false} \\ \text{false,} & \text{if } x = () \text{ is the empty sequence} \\ \text{false,} & \text{if } x = \text{""} \text{ is the empty string} \\ \text{false,} & \text{if } x = 0 \text{ is of numeric type and zero} \\ \text{false,} & \text{if } x = \text{NaN is of type float/double and NaN} \\ \text{true,} & \text{otherwise} \end{cases}$$

There are not boolean literals, but functions `true()` and `false()`.

37/42

## Quantified Expressions

$$\langle QuantifiedExpr \rangle := ( \text{ some } | \text{ every } )$$
$$\$ \langle QName \rangle \text{ in } \langle ExprSingle \rangle$$
$$( \text{ , } \$ \langle QName \rangle \text{ in } \langle ExprSingle \rangle \text{ )*}$$
$$\text{satisfies } \langle ExprSingle \rangle$$

```
1 //book[some $x in author satisfies contains($x, "R.")]
```

Figure 23: Sample XPath query.

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <book>
3   <author>R.E.</author>
4   <author>S.E.</author>
5   <title>XML und DM</title>
6 </book>
7 <?xml version="1.0" encoding="UTF-8"?>
8 <book>
9   <author>E.R.</author>
10  <title>Learning XML</title>
11 </book>
```

Figure 24: Result of the sample query on the document `books-short.xml`.

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

38/42

## Quantified Expressions

```
//book[every $x in author satisfies contains($x, "R.")]
```

Figure 25: Sample XPath query.

```
<?xml version="1.0" encoding="UTF-8"?>
<book>
   <author>E.R.</author>
   <title>Learning XML</title>
</book>
```

Figure 26: Result of the sample query on the document `books-short.xml`.

Course on XML and Semantic Web Technologies, summer term 2007

39/42

## Type Expressions (casting)

$\langle TypeExpression \rangle$ := $\langle ExprSingle \rangle$
     ( ( `instance of` $\langle SequenceType \rangle$ )
     | ( `treat as` $\langle SequenceType \rangle$ )
     | ( `castable as` $\langle SingleType \rangle$ )
     | ( `cast as` $\langle SingleType \rangle$ ) )

$\langle SequenceType \rangle$ := ( $\langle QName \rangle$ | $\langle KindTest \rangle$ | ( `item ( )` ) ) ( `?` | `*` | `+` )? )
     | ( `void ( )` )
$\langle SingleType \rangle$ := $\langle QName \rangle$ `?`?

`instance` and `castable` check if a given expression is of given type.

`cast` casts an expression to a given type.

`treat` disables compile-time checks of expression types, but does not cast at runtime
(i.e., will throw an error, if the expression does not happen to be of correct type).

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007

40/42

## Type Expressions (casting)

To make use of XML Schema types, namespaces have to be declared by means of the host language (XSL, XQuery).

```
1  declare namespace xs="http://www.w3.org/2001/XMLSchema";
2
3  1 castable as xs:string
```

Figure 27: XPath expression using XML schema types, embedded in XQuery.

| | |
|---|---|
| 1 castable as xs:string | true |
| "Hello" castable as xs:decimal | false |
| (1,2,3) instance of xs:decimal* | true |
| (1,2,3) instance of xs:string* | false |
| concat(11, " is prime.") | [compile ERROR] |
| concat(11 cast as xs:string, " is prime.") | "11 is prime." |
| string-join((1 to 10) treat as xs:string*, ", ") | [compiles, but runtime ERROR] |

Prof. Dr. Dr. Lars Schmidt-Thieme, Information Systems and Machine Learning Lab (ISMLL), University of Hildesheim, Germany,
Course on XML and Semantic Web Technologies, summer term 2007
41/42

## Operator Precedence

| prio. | operator | operand types |
|---|---|---|
| | / | |
| | unary +, - | numeric |
| | cast as | |
| | castable as | |
| | treat as | |
| | instance of | |
| | intersect, except | node-sequence |
| | union, \| | node-sequence |
| | *, div, idiv, mod | numeric, durations |
| | +, - | numeric, dates |
| | to | integer |
| | eq, ne, lt, le, gt, ge, =, !=, <, <=, >, >= | simple types |
| | is, «, » | node |
| | and | boolean |
| | or | boolean |
| | for-in-return, if-then-else, some/every-is-satisfies | |
| | , | |
