

## 2. Basic Eclat Algorithm

Most frequent itemset mining algorithms as Apriori [1] and Eclat [10] use a total order on the items  $A$  of the alphabet and the itemsets  $P(A)$  to prevent that the same itemset, called **candidate**, is checked twice for frequency. Items orderings  $\pi$  are in one-to-one-correspondence with **item codings**, i.e., bijective maps  $\sigma : A \rightarrow \{1, \dots, n\}$  via natural ordering on  $\mathbb{N}$
